## EDITOR'S PREFACE

At its inception the series of volumes that were to be included under the title "The Fauna of British India" was limited to seven, which were to deal with the Vertebrata only. On the recommendation of the then Government of India the Secretary of State for India sanctioned the preparation of these volumes in 1883, but the first volume to be published, that on the Mammalia by W. T. Blanford, F R S, did not appear till 1888

The geographical limits of the fauna to be studied were defined in the preface to this first volume as comprising "the dependencies of India, with the addition of Ceylon, which, though British, is not under the Indian Government. Within the limits thus defined are comprised all India proper and the Himalayas, the Punjab, Sind, Baluchistan, all the Kashmir territories, with Gilgit, Ladak, etc., Nepal, Sikkim, Butan, and other Cis-Himalayan States, Assam, the countries between Assam and Burma, such as the Khasi and Naga hills, and Manipur, the whole of Burma, with Karennee, and, of course, Tenasserim and the Mergui Archipelago, and lastly the Andaman and Nicobar Islands. Afghanistan, Kashgaria, Tibet, Yunnan, Siam, and the Malay Peninsula south of Tenasserim are excluded."

When the volumes dealing with the Vertebrata were completed the series was extended to include the Lepidoptera and thereafter the Insecta in general. A few years later it was realised that the series was in danger of becoming overloaded with works on the insects to the almost complete exclusion of all the other groups of animals, the only exception being the Arachnida, which were reported on by the late R. I. Pocock, F R S, in 1900. In 1908 the first of a series of volumes on the Mollusca was published and this was followed at intervals by three other volumes on this group. In 1909 the sanction of the Sec-

retary of State for India was granted for the preparation of volumes on the Freshwater Sponges, Hydroids and Polyzoa by the late Dr. Annandale, and on Leeches by Mr Harding and Prof J. Percy Moore. In the same year it was decided to extend the series so as to include the marine fauna of the Indian coasts, and sanction was accorded for the preparation of two volumes on the Brachyura by the late Lieut-Col Alcock, F.R.S., but Alcock's retirement from India and pressure of work in other spheres prevented the preparation of these volumes. In 1922 the Secretary of State for India was asked to sanction the preparation of a volume on the Madreporarian Corals, but he decided for financial reasons to postpone for a time consideration of any further volumes in the 'Fauna' series.

When the consideration of further volumes was again taken up the marine fauna was not lost sight of and sanction was granted by the Secretary of State for India for the preparation of several volumes on groups of the marine fauna, and with the steady growth of our knowledge of the deep-sea fauna of Indian seas it was decided that this should be included, thus widening very considerably the scope of such volumes. The volumes on the marine fauna, that have up to the present time been sanctioned, are.—

Sponges	by M. Burton.
Echinoidea	by Th. Mortensen <sup>1</sup>
Polychaeta	by P. Fauvel
Cirripedia	by C. A. Nilsson-Cantell.
Copepoda Calanoida	by R. B. Seymour Sewell
Brachyura, Oxyrhyncha	by B. N. Chopra
and Pelecypoda	by Bani Prashad

The preparation of a 2nd Edition of the volumes on Fishes was also entrusted to Dr. S. L. Hora.

With the extension of the series to include the deep-water fauna it has become necessary to define the boundaries of the ocean within which the fauna may be con-

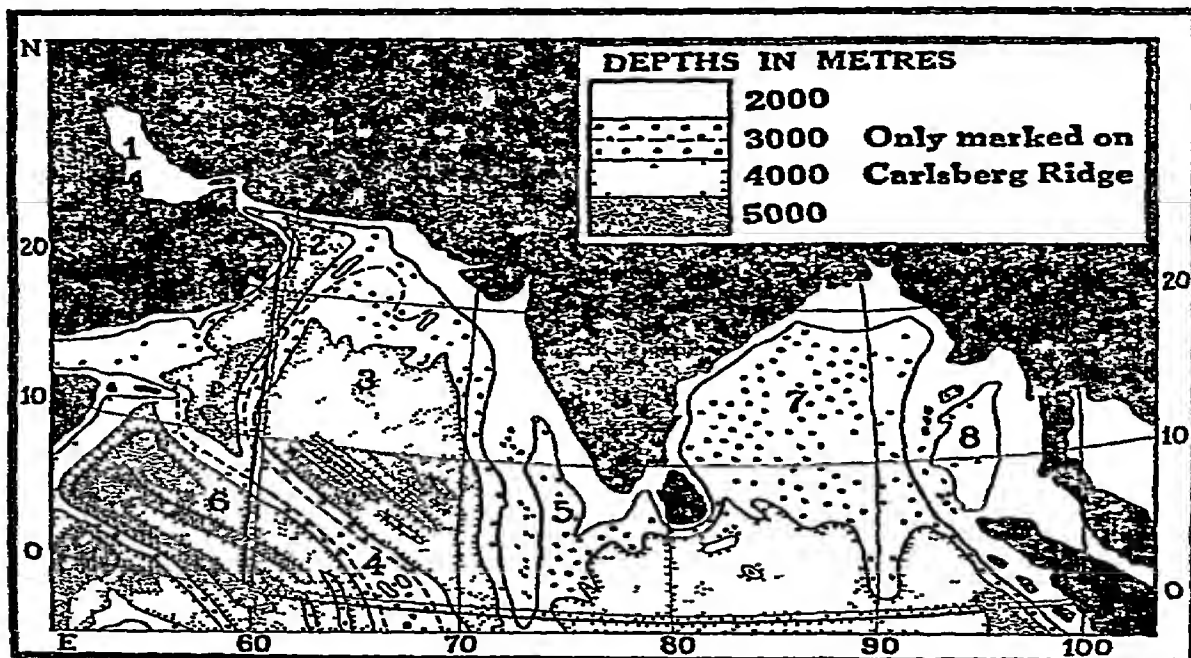

---

<sup>1</sup> The death of Dr. Mortensen, since this was written, has rendered the authorship of this volume vacant.

sidered to belong to Indian waters and the following limits have been accepted:—

On the west the area shall be bounded by the meridian of lat.  $60^{\circ}\text{E}$  as far north as Ras-al-Had, and thus includes the Gulf of Oman and the Persian Gulf

On the south by the latitude  $1^{\circ}\text{S}$  so as to include the whole of the Maldivé Archipelago

On the east by the coast of Burma, by a line drawn from Victoria Point to the northern tip of Sumatra and by the west coast of Sumatra as far south as Lat.  $1^{\circ}\text{S}$ .

The area thus enclosed is shown in the accompanying map, which also indicates the various sub-marine ridges and basins that lie wholly or in part within the boundaries of the Indian region. It is, of course, well known that this area is populated by an Indo-Pacific fauna and hence a certain amount of latitude must be granted to Authors who wish, for one reason or another, to include in their account of the Indian fauna certain species that up to the present time have not been captured within these waters but whose presence there may confidently be expected, and this is all the more necessary

since the land region has now been extended beyond the original scope to include Malaya, where this is possible

As a consequence of the recent change in the Government of India and the division of this region into two new Dominions of India and Pakistan it has become necessary to change the title of the series. In future the series will be known as "The Fauna of India", and the Government of India have decided that the area to be covered shall include India, Pakistan, Ceylon, Burma and, if possible, Malaya. It has also been decided that henceforth the volumes of the series shall be printed in India. The present volume thus becomes the first of a new series.

Acknowledgment and the thanks of both Author and Editor of this volume are due to a number of Scientific Societies and other bodies for permission to reproduce illustrations that have previously been included in the Journals and Memoirs published by them. First and foremost among these is Dr. Chopard and the "Federation Francaise des Sociétés de Sciences Naturelles", to whom we are indebted for permission to reproduce a large number of figures from Dr. Fauvel's Monographs on the "Polychètes errantes" and "Polychètes sédentaires" in the "Fauna de France". Other scientific bodies, to whom our thanks are due, are the Trustees of the British Museum (Natural History), the Royal Society of London, the Linnean Society of London, the Zoological Society of London, the Muséum d'Histoire Naturelle de Paris and the Société Zoologique de France, and to Messrs Taylor and Francis, the Publishers of the "Annals and Magazine of Natural History". Finally, our thanks are tendered to the Director of the Zoological Survey of India for permission to reproduce many figures that have been published in the "Records" and "Memoirs of the Indian Museum".

# POLYCHAETA

## INTRODUCTION

Previous to the year 1861 very little was known concerning the Polychaetous Annelids of India

L K Schmarda, in the course of a journey round the world (1853—1857), spent several months collecting in Ceylon and in his Report "Neue wirbellose Thiere" (1859—61)\* he described about a score of Polychaeta from that island Unfortunately Schmarda's descriptions are generally too vague and too scanty to allow of an accurate identification

In Grube's short paper on the Ceylon Annelids (1874) only six species are described In W Michaelsen's "Polychaeten von Ceylon" (1892) fifteen species were recorded

By far the most important work on the subject is A Willey's "Report on the Polychaeta collected by Prof Herdman at Ceylon" (1905) in which a large number of old and new species are described It was followed by Southern's "Polychaeta of the Chilka Lake" (1921), Augener's "Ceylon Polychaeten" (1926) and "the Littoral Fauna of Krusadai Island, in the Gulf of Manaar," "Chaetopoda", Part I, by Gravely (1927), Part II by Fauvel (1930).

But all these papers are relative to Ceylon and its vicinity and the coasts of the Madras Presidency As for the other parts of India, with the exception of S S Bindra's "Fauna of Karachi" (1927), only casual mention, here and there, of a few species are scattered in papers not specially dealing with India But later the collections of the Zoological Survey of India and of the Indian Museum, Calcutta, have afforded us much more extensive knowledge concerning the Polychaeta, not only from the coasts of India but also from the neighbouring Seas Three hundred species were recorded in Fauvel's Report (1932).

---

\* For full references concerning the papers mentioned see the Index at the end of the volume

The range of the area dealt with in the present work extends from Long 60° E, as far as Cape Ras-al-Hadd, on the western side, the whole of the Persian Gulf and the Baluchistan Coast forming the northern boundary, to the east, the region includes the Malacca Strait, as far as Singapore, whilst the Southern boundary is Lat. 1°S, so as to include the whole of the Maldivé Archipelago

On the Persian Gulf, the Arabian Sea, the Gulf of Oman, the Bay of Bengal, the Maldivé and Mergui Archipelagoes information as regards the Polychaeta is very plentiful but is scattered in a large number of Reports of various expeditions.

Thus we have been able to record 450 species from the given area. Nevertheless, this rather high number hardly represents more than about one-half of the probable total number of the Polychaeta, for, owing to the well known ubiquity of these worms, nearly every species of the Indian Ocean and of the warm parts of the Pacific is likely to be found in the area of the Indian Fauna, as delimited above.

Having had the good fortune to be able to study three hundred species of the Indian Museum, one hundred and nine of the Madras Government Museum, and the material of several expeditions to the Red Sea, Persian Gulf, Indo-China, New Caledonia, Australia and Gambier Islands, nearly all of the 450 species here described have been in my hands, the few exceptions being some rare ones, the description of which I have taken from the original authors

The Polychaete Fauna of India does not materially differ from that of the Gulf of Siam, Malay Archipelago, China Sea, Philippines, Great Barrier Reef, Australia, New-Caledonia, and a great part of the Pacific. It must also be borne in mind that many Polychaetes are really cosmopolitan. Out of the 450 species here recorded 108, nearly one-fourth, are also European species

## ANNELIDA POLYCHÆTA

The Polychaeta and the Oligochaeta are two important divisions of the Chaetopoda, annulated worms endowed with locomotive bristles or setae. But the bristles of the Oligochaeta are few and directly set on the body-walls, which are destitute of parapodia or feet. Other appendages are also wanting. On the other hand, the bristles of the Polychaeta are usually very numerous and borne on clearly marked parapodia, lateral expansions, or feet, of the teguments. The body generally carries various appendages such as tentacles, palps, cirri, branchiae, etc. Moreover, the Polychaeta are very generally marine animals with separate sexes, whilst the Oligochaeta live in fresh water or damp earth and are hermaphrodite.

## MORPHOLOGY

Fig 1

The body is generally elongated, with numerous segments. It consists of a *Prostomium* or anterior cepha-

Fig 1—*a*, *Lepidonotus* Leach, *b*, *Notopygos* (Amphinomid), *c*, *Callizona* (Alciopid), *d*, *Glycera* (Glycerid), *e*, *Nereis*, *f*, *Arenicola*, *g*, *Travisia* (Ophelid), *h*, *Pectinaria*, *i*, *Terebella*, *k*, *Sabella*, *l*, *m*, *Mercierella* and tube (Serpulid)

lic lobe, a *Metastomium* including all the following segments, and a *Pygidium*, the last segment.

A few anterior segments, more or less modified, may be fused with the prostomium to form a kind of head with various appendages such as *antennae* or tentacles, *palps* and *tentacular cirri*.

In the *Errantia*, the segments of the metastomium are often very numerous and nearly all alike, as in the NEREIDAE, SYLLIDAE, EUNICIDAE, etc., whilst in the *Sedentaria* the body, sometimes shorter, is often clearly divided into distinct regions such as thorax, abdomen, and tail.

The prostomium, a cephalic lobe, the anterior part of the so-called head, is sometimes reduced to a mere cone, blunt or sharp, and destitute of any appendages, as in *Lumbriconereis*. It is a long annulated cone, with four small tentacles at the tip, in *Glycera*, square or scute-like in *Nephtys*, more or less complicated with several appendices in Nereids, APHRODITIDAE and EUNICIDAE, or reduced to a mere ridge in Sabellids and Serpulids.

The prostomium generally carries one, two or more pairs of eyes, mere eye-spots, single or compound, or sometimes highly differentiated organs such as the big red eyes of the Alciopids, with a cornea, a lens and a retina.

### *Appendages* (Fig 2).

The appendages of the Polychaeta are various processes of the teguments which may be classed into two groups. The first are merely epidermic solid projections, as the *styles* and *stylodes*. The others are hollow and are formed by an evagination of the body wall.

When the antennae, palps and cirri are borne on a hollow base, this last is termed '*phore*'. Such an antenna is then divided into a solid distal part, or *ceratostyle*, and a basilar hollow part or *ceratophore*, a palp is divided into a *palpostyle* and a *palpophore*, a cirrus into a *cirrostyle* and a *cirrophore*.

Amongst the cephalic appendages are. (1) the *palps*, innervated by a large nerve issuing from the anterior part of the brain. They may be simple, elongated, prehensile (SPIONIDAE) or short, simple, or articulate (SYLLIDAE, NEREIDAE); (2) the *antennae* or tentacles, innervated from the middle brain, (3) the tentacular cirri, borne on

the *metastomium* (buccal segment), or on the segments fused with the *prostomium* to form the head

The *Parapodia*, or feet, are more or less complicated lateral processes of the body-wall. These organs, with the

Fig 2—*a*, head and proboscis of *Phyllodoce*, *b*, head of *Nereis*, *c*, anterior part of *Syllis*, *d*, of *Glycera*, *e*, of *Nephthys*, *f*, of *Lepidonotus*, *g*, of *Ampharete*, *h*, of *Lumbriconereis*, *i*, of *Glymene*, *k*, of *Nerine*, *l*, proboscis of a Polynoid, front view with papillae and jaws (*at*, tentacles, *br* gills, *ct*, tentacular cirri, *el*, elyptrophore, *p*, palps, *pp*, palpophores, *pr*, prostomium, *on*, nuchal organs)

bustles they carry, provide the most important features for the identification of the species. Typically, each segment carries one pair of parapodia divided into two *rami*, a dorsal one, or *notopodium*, and a ventral or *neuropodium*. When both *rami* are borne on a common base the biramous foot is said to be monostichous, when both *rami* are quite distinct and more or less apart, as in most *Sedentaria*, it is termed distichous (Fig 3). For instance, in a biramous parapodium of *Nereis* there are, (1) two setigerous lobes (or chaetigerous sacks) carrying the setae and supported by a stout, enclosed, bodkin-like bristle or *aciculum*, (2) parapodial lobes, lips or fillets, (3) a dorsal and a ventral *cirrus*. Branchiae, or gills, simple or branched may be inserted upon the dorsal ramus or between the two *rami*.

The parapodia are *biramous* when both rami are nearly equally developed, *subbiramous* with a dorsal cir-

Fig 3—Parapodia *a*, subbiramous, of *Podarke pallida* Claparède, *b*, of *Eunice*, *c*—*d*, biramous, clytioigerous and cirriferous of an Aphroditid, *e*, biramous of *Nereis*, *f*, biramous of *Nephthys*, *g*, sesquiramous of *Staurocephalus*, *h*, uniramous of *Phyllo-doce*, *i*, distichous of *Amphiteis*, dorsal ramus and ventral pinnule, *k*, of an *Aricia*, *l*, distichous of *Arenicola* (*ac* aciculum, *br*, gills, *cd* dorsal cirrus, *cv*, ventral cirrus *el*, elytron, *pi*, pinnule, *to*, uncinigerous torus)

rus but the dorsal setae-sack and setae more or less reduced, *sesquiramous* when the dorsal lobe is reduced to a few bristles or acicula, *uniramous* when the dorsal ramus is practically wanting, being reduced to the dorsal cirrus.

In the *Sedentaria* the *neuropodia*, or ventral rami, are often reduced to mere transverse ridges, or *uncinigerous tori*, destitute of a cirrus and carrying short hooks or *uncini*.

*Setae* (or *chaetae*) are chitinous bristles which are very important for the classification and are of very varied shapes and disposition. They may be divided into two groups (1) the setae *s. str.*, or bristles, and (2) the *uncini*, avicular or acicular hooks.

The setae are simple, jointed, or compound. They may be long, slender, filiform, hair-shaped, *capillary*, smooth or spinulose, curved, flat, limbate, or winged on one or both sides, with fells or transverse rows of spines, geniculate, trumpet-shaped, exceptionally forked at the tip, etc (Fig 4). When they are short, stout, bodkin-

shaped, or flattened, paddle- or oar-shaped, they are called *paleae*. The articulated, or many-jointed setae of the *CHLORAEIDAE* and *SIGALIONINAE* are a connecting link with the compound setae with a basal part, or stalk, and a terminal piece elongate, needle-like, or short, sickle-shaped. When both sides of the articulation are the same length it is termed *homomorph*, and *heteromorph* when they are unequal.

The ventral uncini of the *MALDANIDAE* and *CARTILLAGIDAE* are sigmoid hooks with a rostrum, a pedicel and a manubrium. The uncini of the *Sedentaria* are often short denticulate plates, such as the apical hooks of the *SABELLIDAE* and *TRENCHIDAE*, with a broad basal manubrium and a beak-like hook, crested with denticles.

on the vertex They are set on the tori in one or two parallel rows (Fig 5).

**Proboscis** Many *Errantia* are provided with an eversible proboscis armed with strong horny jaws, or beset with papillae, or with chitinous denticles, or *paragnaths*

The *intestine* is generally straight, rarely coiled, sometimes with glands or diverticula

**Body cavity** In the *Errantia* the body-cavity, or coelom, is generally divided by numerous intersegmental septa, or diaphragms In the *Sedentaria* these septa are few and generally restricted to the anterior part of the thorax

**Muscles** The muscles are smooth, set in circular layers and stout longitudinal fascicles Oblique muscles run from the sides to the middle of the ventral side

**Nephridia**, or excretory organs, are disposed in pairs on succeeding segments with lateral pores opening on the sides near the feet In the *Sedentaria*, they are generally reduced to a few thoracic pairs The anterior ones,

in front of the diaphragm, are purely excretory organs, whilst the others are also used as genital ducts

The *vascular system* is generally closed and well developed, sometimes very complicated and offering many variations. The dorsal vessel is contractile, but special organs of propulsion, or hearts, may also exist

The *blood* is red, or emerald green in SABELLIDAE, SERPULIDAE, CHLORAEEMIDAE, but is often uncoloured. The respiratory pigments, haemoglobin or chlorocruorin, are in solution in the plasma, only very exceptionally in corpuscles

*Respiration* is effected by means of branchiae or gills, of which there are two kinds (1) genuine branchiae, with vascular loops, and (2) lymphatic gills destitute of vessels and filled with coelomic fluid. The gills exhibit very numerous and varied types. They may consist of simple filaments, straight or coiled, forked or pectinate, set on the dorsal ramus of many feet, or branched or bushy and restricted to the anterior segments, disposed as a terminal funnel of many filaments on the head of Sabellids and Serpulids, etc

*Sense organs* The sense organs are the eyes, the nuchal organs, the lateral organs and the statocysts or otocysts. The eyes are not always restricted to the prostomium. The branchial filaments of the Sabellids often bear dorsal or subterminal eyes. The OPHELIIDAE have lateral eye-spots disposed on a number of segments and the pygidium of little Sabellids may carry several eye-spots. We have already mentioned the large eyes of the ALCIOPIDAE. The lateral organs are small ciliated cups, or knobs, present on a number of segments in the CAPITELLIDAE, OPHELIIDAE, ARICIIDAE, etc

Otocysts, or statocysts, exist only in very few species (ARENICOLIDAE, ARICIIDAE, TERESELLIDAE and SABELLIDAE)

*Colour.* Many species are adorned with bright colours and variegated patterns. Unhappily, these colours do not keep well in the preservatives, formol or alcohol. They are due to the red, or emerald green, blood and to solid or dissolved pigments of the epidermis, such as Haemoglobin, Chlorocruorin, Haemerythrin, Tetronerythrin, Melanin, Uranidin and various Lipochromes. These pigments, with the exception of Melanin and a few others, are either dissolved or altered by the preservative fluids

On the other hand, the splendid iridescence of the bristles of *Aphrodita* and CHLORAEMIDAE, as well as of the body-wall of Eunicids and others, displaying all the changing hues of the rain-bow, are permanent for they are caused by diffraction of the light either by the numerous very fine striae of the setae or the very thin lamellae of the cuticle and these structures are not affected by the spirit.

*Phosphorescence* is not restricted to the Syllids and other small pelagic species which abound in the plankton, it is also a property of many Annelids creeping on the rocks and algae, and even of tubicolous species. For instance, the luminescence of *Chaetopterus*, living on the bottom inside a thick parchment-like tube, is the most beautiful of all.

## REPRODUCTION

The sexes of the Polychaeta are usually separate and even sexual dimorphism may occasionally occur. Nevertheless, a few species are hermaphrodite, especially amongst SABELLIDAE and SERPULIDAE. The ova and spermatozoa are discharged into the sea. The fertilised eggs give rise to a floating Trochophore larva, and then to post-larval stages dropping to the bottom or swimming for a long period.

Asexual reproduction, Blastogamic or Schizogamic, is frequent amongst Syllids and a few other Polychaeta.

*Epitoky* A number of Polychaeta, especially amongst SYLLIDAE, NEREIDAE and in a few EUNICIDAE, undergo a peculiar metamorphosis at the epoch of reproduction, acquiring new long swimming bristles, and developing large foliaceous lobes on the feet, whilst the eyes grow larger. For instance, in *Nereis*, the eyes become larger, a few of the anterior dorsal cirri grow thicker at the end, but the anterior segments are not otherwise materially altered, the middle and posterior segments, however, become flattened and crowded together, the enlarged feet develop broad foliaceous lamellae, and shed their bristles which are replaced by new oar-shaped swimming setae. When maturity is perfect and the metamorphosis complete, these *Heteronereis* stages rise in swarms to the surface of the sea, shed their sperm and ova, and then die. In the case of the "Palolo" (*Eunice viridis*), an Eunicid of the Pacific, the posterior part of the worm, a little modified and filled with genital products, breaks off from the ante-

rior part, which remains in the coral reefs, and rises in swarms to the surface where it is taken up for food by the natives. Singularly enough the rise of the "Palolo" is connected with lunar phases. It is very probably the only instance of an edible Polychaete.

### *Autotomy and Regeneration*

Autotomy is wide-spread amongst Polychaeta. The *POLYNOINAE* easily shed their elytra, the *SPIONIDAE* their palps, the *AMPHARETIDAE* and *TEREBELLIDAE* their gills or their tentacular cirri. Many *EUNICIDAE*, *CAPITELLIDAE* and others are so brittle that it is but too often difficult to obtain a whole specimen.

This propensity to autotomy is counterbalanced by a great facility of regeneration and may be turned into a mode of asexual multiplication as in *Phyllochaetopterus* and *Dodecaceria*. It is not uncommon to find a more or less long fragment of the mid-body of an Eunicid having regenerated both a head and a tail. In *Procerastea* and *Dodecaceria* a fragment composed of two segments, or even a single segment, may thus regenerate a whole worm.

## HABITS

As already stated the Polychaeta are marine animals, nevertheless a few species can live in brackish water and even, though infrequently, in fresh water. In the brackish water of the Chilka Lake, the Salt Lakes near Calcutta, the Gangetic Delta, and the Taleh Sap, for instance, a few genuine marine species occur with several others more closely adapted to water of low salinity, such as two small *Nephtys*, *Dendronereides heteropoda*, two *CAPITELLIDAE*, and two small *SERPULIDAE*, *Ficopomatus macrodon* and *Mercierella enigmatica*. But species living in fresh water, or water of so low a salinity as to be drinkable, are of much rarer occurrence. Such are however several *Lycastis* and a few other *NEREIDAE*, several *SABELLIDAE* of the Baikal Lake, *Mercierella enigmatica* of world-wide distribution in estuaries and rivers, and another little Serpulid, *Marifugia cavatica*, found living in the deep caves of the Karst Region.

The Polychaetes are plentiful on the shore between tide-marks, on coral reefs, and in the shallow littoral waters as far as 200 fathoms, but beyond this, as the depth increases, the number of species rapidly decreases and they

become very scarce in the deep-sea dredgings. But, singularly enough, in the deep-sea fauna many shallow-water species are found associated with rare genuine abyssal forms. For instance, *Amphicteis gunneri*, often collected between tide-marks, has been dredged by the Prince of Monaco in 1885 metres, and in 2750 fms by the "Challenger", and the common shore Serpulids, *Hydroids norvegica* and *Pomatoceros iniqueter*, at 4808 m.

Polychaeta are hence very little affected by depth and pressure.

Genuine pelagic species, usually transparent, and numerous larval and post-larval forms are part of the plankton.

For the most part, the others live on the bottom, boring in the sand or mud, fixed on stones or shells, creeping amongst algae, or burrowing in the crevices of rocks and corals, or amongst stones and shells incrustated with calcareous algae, Sponges, Ascidians and Polyzoa. Some are commensal or ectoparasitic on Hydroids and Echinoderms.

Several of the so-called *Errantia* live nevertheless inside tubes, whilst true *Sedentaria* are sometimes tubeless or vagabond. The limivorous species swallow mud or muddy sand, like the earthworms. The Sabellids and Serpulids, which cannot leave their tubes, feed by means of their branchial tufts, the radii or barbules of which collect the plankton and the small particles of food floating in the water and their cilia carry them to the mouth. Certain *Errantia*, the proboscis of which is armed with stout horny jaws, such as the APHRODITIDAE, NEREIDAE and EUNICIDAE are prowling and hunt living prey.

## GEOGRAPHICAL DISTRIBUTION

Most of the species of Polychaeta have a very wide distribution and many are quite cosmopolitan, so that they cannot be grouped into Zoological Provinces. For instance, amongst the 450 species, here recorded from the Indian area, 108, nearly a fourth, are common on the western shores of Europe.

A comparison of the genuine pelagic Annelids of the plankton of Indo China shows a nearly complete identity with those of the Atlantic.

Many of the Arctic circumpolar Annelids, with the exception of a few peculiar species, are also found in the

temperate Atlantic and Pacific Oceans. In the tropical area, whilst many disappear in the littoral zone, a number of them is still to be found in the deep-sea dredgings, and some of these northern species reappear on the temperate or cold shores of the south-hemisphere.

Antarctic species reach to the south parts of America, Australia and Africa.

Most of the intertropical species are also the same all round the world.

In the Fauna of Japan both arctic and tropical forms are found. This is easily explained. Two streams run along the coasts of Japan: a cold one, the Oja-Siwo, runs down from the glacial Arctic Ocean along the coasts of Kamchatka, Manchuria, Korea and the North-West coast of Japan, bringing with its cold waters the northern species of Polychaeta, whilst the Kuro-Siwo brings to the Eastern coasts the warm waters of the tropical Pacific with part of their fauna.

In short, the distribution of the Polychaeta is mainly regulated by the temperature. In the great depths of the Oceans the temperature is both very low and very uniform all over the world and the Annelidan fauna is also very uniform and contains moreover a number of arctic species which find there the same cold temperature. For the same reason, in the intertropical area the shore and shallow-water species, especially those of the coral reefs, finding the same conditions in the three oceans, are nearly all identical.

The Polychaeta are indeed very sensitive to the temperature and an abrupt rise or fall of a few degrees sometimes kills them outright.

## COLLECTING

Pelagic Annelids are easily procured by the towing of a plankton net. Night fishing with artificial light will thus procure a lot of Syllids, epitokous Nereids and many rare small species and larvae. Shore collecting will yield the most varied and abundant crops.

The necessary implements are a stout spade, a crow-bar, a chisel and a canvas bucket, or a fisherman's basket with several glass jars and a number of glass tubes.

Care must be taken to separate large predatory species such as Nereids, Eunicids and Aphroditians. These large and ravenous species, whilst being carried home, are

better kept in damp sand or amongst algae than in water bottles.

Many species burrowing in sand or mud are caught by turning it over with the spade. Each clod must be carefully broken into small parts with the fingers, avoiding any injury to small and delicate species. The sand may also be washed through a sieve in little pools of water.

Many Annelids are to be found creeping on stones or algae or in tubes incrusting them. Loose stones should be carefully turned over and examined, and should then be replaced in their previous position to avoid the decay of the fauna fixed on the upper surface. The crow-bar is used to rip open the crevices of rocks and corals in which a very rich and varied fauna is usually found.

In dredging and trawling, when the dredge or trawl comes on board, and the contents are scattered on deck, it is easy to pick up the large specimens. To search the rubbish for small species, shells and stones coated with Serpulids, Polyzoa, Algae, etc., should be put into broad, shallow, glass vessels, or, better still, into white china wash-hand basins, with sea water. When the water becomes putrid the small boring species and others ensconced in tubes or crevices come out and reach the edges of the vessel where they can easily be picked up.

## PRESERVATION

The best preserving medium for Polychaeta is 70–75% alcohol. Formalin is very bad, quite detrimental to good preservation for the specimens rapidly become soft, sticky and nearly useless. Nevertheless, in an emergency, and for large species, it may be used for a short time previous to spirit (5% of the commercial solution of formalin). On the other hand, when specimens have been first hardened in strong spirit they may next be kept in formalin with less inconvenience.

For histological purposes, Bouin, Brasil or Zenker fluids are amongst the best.

Delicate and brittle species must be narcotised previously to fixing in spirit. This is easily done by adding *very gradually*, small quantities of alcohol (up to 5% or 10%) to the sea water. Other anaesthetics such as cocaine, chloral, etc., may also be used for the same purpose. To avoid too great a contraction of large species they may first be put into very weak spirit (30–40%) and be

kept well stretched with pincers, or bamboo or horn spatulae, and as soon as they cease to react they should be immersed in 70–90% alcohol. To ensure a good preservation the volume of alcohol must be greater than the specimen's and it must be renewed after a few days.

Preserved specimens should be kept separate in glass tubes, the smaller ones, in small tubes with a cotton-wool stopper, are packed together in larger vessels filled with 70–75% alcohol. The paper, or parchment, labels must be put *inside* the tubes with inscriptions, in pencil or permanent Indian-Ink, carefully noting the date and locality, the colour of the living animal and other particulars.

## IDENTIFICATION

To identify a specimen it is necessary carefully to note the divisions of the body, if any, the form of the prostomium, the eyes, the tentacles, tentacular cirri, gills, and the proboscis with its jaws and denticles, when there is one. Next in importance are the parapodia or feet with their bristles of high specific value. But as the structure of the feet and the form of the setae often vary materially in the anterior, middle and posterior parts of the body it is always necessary to examine a number of them. This is easily done by tearing, or cutting, with sharp pincers, or scissors, a whole series of feet, say nine for a *Nereis*, and disposing them in three rows on a slide, three anterior, three median and three posterior ones, the relative numbers of the segments they belong to being carefully noted on the label.

If a permanent preparation be wanted, rapidly drain the alcohol from the slide and before the parapodia get dried drop on them a small quantity of melted gelatin-glycerin, put on a cover-slip and warm slightly, if necessary, the preparation will then keep for years.

Mounting in Canada balsam is not recommended, the setae—unless previously coloured—becoming too transparent and the fine structures indiscernible.

## CLASSIFICATION

### ANNELIDA POLYCHAETA

Annulated worms with numerous specially differentiated chitinous bristles carried on parapodia, or feet,

lateral processes of the segment's body-wall Various appendages present, antennae, palps, cirri, gills Marine animals, very exceptionally living in fresh water Sexes usually separate

## I *ERRANTIA*

Body usually vermiform, very long, segments numerous, nearly all alike, the first near the mouth excepted Generally with cephalic appendages, antennae, palps, tentacular cirri, feet uniramous or biramous, with both rami hardly different, acicula present, frequently gills above the feet.

## II *SEDENTARIA*.

Body divided into distinct regions Head small, hardly distinct or greatly modified Feet generally simple, the ventral rami are often *tori*, or pinnules, with hooks or *uncini*, gills usually limited to a part of the body Usually tubicolous

According to Benham, the families may be grouped as follows

### A PHANEROCEPHALA

(Head distinct)

#### *Sub-Order I Nereidiformia (Errantia auct and Aricidae)*

Antennae and palps Peristomium with special cirri Eversible proboscis often with jaws

*Families* SYLLIDAE, HESIONIDAE, APHRODITIDAE, PHYLLODOCIDAE, TOMOPTERIDAE, NEREIDAE, NEPHTHYDIDAE, AMPHINOMIDAE, EUNICIDAE, GLYCERIDAE, SPHAERODORIDAE, TYPHLOSCOLECIDAE and ARICIDAE

#### *Sub-Order II. Spioniformia*

Prostomium reduced to a mere knob, neither tentacles nor palps Eversible proboscis without jaws The peristomium usually carries a pair of long tentacular cirri and extends forwards at the two sides of the prostomium.

*Families.* SPIONIDAE, CHAETOPTERIDAE, MAGELONIDAE and AMMOCHARIDAE.

*Sub-Order III. Terebelliformia*

Prostomium destitute of appendages The achaetous peristomium may carry cirri and tentacles Proboscis not eversible, unarmed

*Families.* CIRRATULIDAE, TEREPELLIDAE, AMPHARETIDAE and AMPHICTENIDAE

*Sub-Order IV Capitelliformia*

No prostomial processes Peristomium without appendages Proboscis unarmed An accessory gut No blood vessels Lateral sense-organs

*Family* CAPITELLIDAE

*Sub-Order V Scoleciformia.*

Antennae and palps wanting Peristomium without appendages Proboscis unarmed Blood vessels present

*Families:* OPHELIDAE, MALDANIDAE, ARENICOLIDAE, SCALIBREGMIDAE, CHLORAEMIDAE and STERNASPIDIDAE

**B CRYPTOCEPHALA**

(Head indistinct)

*Sub-Order I Sabelliformia*

Prostomium entirely hidden by the forward extension of the peristomium Palps greatly developed, branched and acting as respiratory organs Tube membranous or calcareous

*Families* SABELLIDAE, ERIOGRAPHIDAE, AMPHICORINIDAE and SERPULIDAE

*Sub-Order II. Hermelliformia*

Peristomium enormously developed and forming a bilobed hood capable of closing over the mouth

*Family:* HERMELLIDAE

*Key to the Families.*

|    | Prostomium with, or without two short tentacles, both parapodial rami more or less conspicuous Capillary setae and forked setae No hooks   |   | SCALIBREGMIDAE, p. 354 |

- Prostomium blunt, without appendages or with a crown of lacinated lobes Without branchiae Ventral tori with many rows of very small uncini Sandy tube OWENIDAE, p 390
- Prostomium with a keel, or a rimmed cephalic plate, without process An anal plate or an anal funnel with cirri Without branchiae Dorsal setae capillary Ventral tori with elongated sigmoid hooks MALDANIDAE, p 375
- 8 A terminal branchial tuft with numerous filaments bearing secondary processes Prostomium indistinct Uncini ventral in the thoracic region, dorsal in the abdominal region Tube membranaceous or calcareous 17
- Without terminal branchial tuft 9
- 9 Modified setae (paleae) forming an operculum closing the tube 16
- Without opercular setae 10
- 10 Prostomium conical or blunt, without process Branchiae on many segments 13
- Prostomium more or less distinct One pair of tentacle-like palps or numerous tentacular filaments 11
- 11 Prostomium with or without two small tentacles Two long canaliculated palps 2-3 strikingly dissimilar regions, the anterior short, with uniramous feet bearing peculiar setae in the fourth setigerous segment Posterior notopodia erect Uncini comb-like CHAETOPTERIDAE, p 336
- Without tentacles A cephalic veil and numerous tentacular filaments Ventral tori with pectinate uncini 12
12. Tentacular cirri retractile into the mouth Prostomium distinct 3-4 pairs of subulate branchiae inserted on the first segments AMPHARETIDAE, p 406
- Tentacular cirri not retractile into the mouth Prostomium indistinct Branchiae arbore-scent, or rarely subulate, one,

- two or three pairs in number,  
inserted on the first segments,  
they are sometimes wanting TERESELLIDAE, p 415
- 13 With uncinigerous tori 15  
Without uncinigerous tori 14
- 14 Serrated capillary setae and acicular hooks Feet and branchiae conspicuous and erected on the back of the abdominal region . ARICIDAE, p 300  
Only capillary setae. Feet without lobes Branchiae lateral and ligulate Prostomium sharp, conical . OPHELIIDAE, p 357
- 15 Prostomium blunt. Anterior region abbranchiate, middle region with dorsal arborescent branchiae not retractile; often an achaetous and abbranchiate caudal region .. ARENICOLIDAE, p. 375  
Prostomium conical. Anterior region abbranchiate; posterior region with branchiae simple, rudimentary or wanting, or sometimes multifid and then retractile into lateral pouches In the abdominal region dorsal and ventral tori with sigmoid hooded hooks CAPITELLIDAE, p. 362
- 16 An operculum of one anterior row of large golden setae (paleae) Posterior region (scapha) very small, leaf-like and with hooks at the base Two pairs of anterior foliated branchiae. A free tube of sand-grains, slightly conical, open at both ends . AMPHICTENIDAE, p. 402  
Two large opercular stalks bearing a crown of paleae Branchiae dorsal and numerous A narrow smooth achaetous and abbranchiate caudal region Fixed tubes of sand grains often clustered in big reef-like masses .. SABELLARIDAE, p 393
17. Without operculum. No thoracic membrane Tube membranaceous or mucous SABELLIDAE, p 437  
Usually with an operculum A thoracic membrane. Tube calcareous .. SFRPULIDAE, p 452

## POLYCHAETA ERRANTIA

## Family APHRODITIDAE Savigny

Body short, ovate, or long and vermiform Prostomium rounded or bilobed One, or three, tentacles, 2 palps, 2 pairs of tentacular cirri with setae Proboscis cylindrical bordered with soft papillae and with 4 chitinous jaws (*HERMIONINAE* excepted) Dorsally rounded, flattened pairs of elytra alternating, more or less regularly, with dorsal cirri. Feet biramous Dorsal setae simple, ventral setae simple or compound

*Remarks.* The chief character of the family is the presence of elytra which are flattened discoidal organs borne on the dorsal surface of the feet, usually imbricated, often fringed and covered with papillae.

*Key to Subfamilies*

Genus **APHRODITA** Linnaeus.

Eyes sessile Elytra hidden under a thick, close felt. Ventral bristles acicular, disposed in 3 tiers Dorsal setae of two kinds, (1) stout, smooth, piercing the felt, (2) very long and slender, iridescent

*Key to the species of Aphrodita*

- |  |                                |

Dorsal setae short, erect, blackish, protruding very little over the dorsal felt Slender lateral setae beautifully iridescent Ventral setae smooth, without lateral hook

*Length.* 100—200 mm.

*Occurrence* Santapalli, Madras Presidency

*Distribution* Japan, Indian Ocean, Mediterranean Sea, Atlantic Ocean, North Sea and English Channel.

Fig 6—*Aphrodita aculeata* Linn a, natural size, b, head, c, cirriferous foot, d, bipinnate seta from an anterior foot; e, spinous bristle from one of the last segments, f, stout dorsal bristle  $\times 35$ , g, hairy ventral seta of the young  $\times 40$

Large dorsal setae, golden, long, curving backwards over the back, with a slender end. Ventral setae smooth. Dorsal felt rough and thick. Lateral slender setae faintly iridescent.

*Length* up to 100 mm by 50 mm*Occurrence* Laccadive Sea, 637 fms; West of Comorin, 670 fms*Distribution*: Japan, Australia, Indian Ocean3. *Aphrodita talpa* Quatrefages (Fig 8, a-l).*Aphrodita talpa*, Quatrefages, 1865, I, p. 196, pl III, fig 24 (non Ehlers, nec Benham, Fauvel 1917, Augener) Fauvel, 1925, p 140, fig 4? *Aphrodita castanea*, Moore, 1910, p 380, pl XXIII, fig 85-97.? *Aphrodita longipalpa*, Essenberg, 1917, p 403, pl XXI, fig 1-14.

Fig 8—*Aphrodita talpa* Quatrefages a, b, ventral hairy bristles from mid-body  $\times 109$ , c, d, bipinnate and hastate bristles from 2nd foot  $\times 109$ , e, f, g, superior and inferior ventral bristles of a posterior foot  $\times 109$ , h, i, k, upper median and lower bristles from a hind foot  $\times 109$ , l, dorsal capillary coated with mud  $\times 47$

Dorsal bristles with a slender end. Lateral capillary setae lustreless, or very faintly iridescent, more or less densely coated with cylinders of mud. Ventral setae hairy, without any hook or spur.

*Length.* 15–30 mm. by 13–25 mm.

*Occurrence* Andaman Islands, Bay of Bengal, Orissa Coast, Malabar Coast, Laccadive Sea, Gulf of Oman

*Distribution.* Pacific Ocean, China, New Zealand, South Australia, Indian Ocean

### Genus APHROGENIA Kinberg.

Sabre-like dorsal bristles. Ventral setae bifurcated Without dorsal felt.

#### 4. *Aphrogenia alba* Kinberg (Fig 9, a–h).

*Aphrogenia alba*, Kinberg, 1857, p 6, pl II, fig 6 Fauvel, 1932, p 9

*Aphrogenia villosa*, Horst, 1917, p 63, pl XIV, fig 10–12 Augener, 1926, p 439

Fig 9—*Aphrogenia alba* Kinberg a, big dorsal bristle coated with parasitic Algae X47; b, dorsal knobbed seta X47; c, end of same X117, d, sabre-like dorsal bristle X47, e, f, g, three ventral furcate setae, h, bipinnate seta from the first setigerous segment X230 *Lepidonotus melanogrammus* Haswell a', foot X8, b', posterior ventral seta X62, c', anterior bidentate seta X62, d', e', bristle front and side view, X117.

Elytra 13 pairs, uniformly white, with a faint mother-of-pearl gloss and with scattered minute papillae. Dorsal cirri long, with a clavate tip. Dorsal bristles stout and curved. Ventral setae with two unequal limbs, sometimes villose with a parasitic growth. Elytra uniformly white or pearly, sometimes with a faint pattern.

*Occurrence* Port Blair, Andamans, Ceylon

*Distribution* Malay Archipelago, Indian Ocean, West Indies

Genus *HERMIONE* Blainville.

Harpoon-shaped dorsal bristles. Ventral setae bifurcated and toothed, but not fringed. Dorsal felt absent.

5. *Hermione hystrix* (Savigny) (Fig. 10).

*Hermione hystrix*, Fauvel, 1923, p. 35, fig. 11 (Synonymy), 1932, p. 10.

*Hermione malleata*, Grube, 1878, p. 17. Willey, 1905, p. 245, pl. I, fig. 3-4, Potts, 1909, p. 329, Horst, 1917, p. 52, pl. XII, fig. 11-13.

Fig. 10—*Hermione hystrix* (Savigny) a, dorsal view, natural size, b, elytron  $\times 4$ , c, d, elytrigerous and cirriferous feet, e, head, f, dorsal sabre-like bristle, g, h, harpoon shaped bristles, i, k, ventral bristles

Body oval, flattened. Median tentacle very variable in length. Elytra smooth. Dorsal bristles erect, diverging, spear-like, with lateral recurved fangs at the tip which is often enclosed in a sheath. Ventral setae bifurcated

with a short limb and a longer one curved, smooth (or toothed in the anterior and posterior feet)

*Length* 50—60 mm

*Colour* pale brown

*Occurrence* Nankauri, Nicobar Islands, Ceylon.

*Distribution* Philippine Islands, Malay Archipelago, Indian Ocean, Red Sea, Mediterranean, Atlantic.

### Genus LAETMATONICE Kinberg

Harpoon-shaped dorsal bristles. Ventral setae bifurcated, with a fringe of hairs at the distal end. A dorsal felt, sometimes very little developed.

#### 6 *Laetmatonice producta* Grube, var *benthaliana* McIntosh (Fig. 11, f—g).

*Laetmatonice producta*, McIntosh, 1885, p. 45, pl. VIII, fig. 4—5, pl. IV, fig. 12. Moore, 1903, p. 420. Izuka, 1912, p. 89, pl. IX, fig. 7—10. Fauvel, 1932, p. 10.

Elytra 15—18 pairs, delicate, finely granular with radiating lines. No dorsal felt (?) Dorsal spines very large, with 3—4 fangs on each side. Slender bristles from the inner dorsal tuft overlapping the elytra. Ventral setae with a spur and a long fringe of hairs. Ventral cirri small, filiform, inserted about the middle of the foot, which is long and slender.

*Occurrence.* Ceylon.

*Distribution:* Japan, Indian Ocean.

### Genus PONTOGENIA Claparède.

Dorsal bristles (paleae) golden yellow, slightly bent, arranged like a fan. Ventral setae few, bifid. A dorsal felt usually present.

#### *Key to the species of Pontogenia.*

- |                   |    |    |                            |
|-------------------|----|----|----------------------------|
| 1. No dorsal felt | :  | .. | <i>nuda</i> Horst, p. 30   |
| A dorsal felt     | .. | .. | <i>indica</i> Grube, p. 29 |

#### 7 *Pontogenia indica* Grube.

*Pontogenia indica*, Grube, 1878, p. 19, pl. I, fig. 4, Willey, 1905, p. 246, pl. I, fig. 5.

Elytra 18 pairs. 43—45 segments. Back covered by the bent dorsal setae (paleae). A dorsal felt. Palps beset with longitudinal rows of delicate recurved papillae. A granulated facial tubercle. Two pairs of eyes on ommatophores. Paleae rather narrow, denticulated on each side. Ventral setae short, stout, bidentate.

*Length:* 20 mm—26 mm

*Occurrence.* Ceylon, Singapore

*Distribution* Philippine Islands, Indian Ocean.

8. *Pontogenia nuda* Horst. (Fig 11, *a* and *b*).

*Pontogenia nuda*, Horst, 1917, p 62, pl XIV, fig 5—7.

Fig 11.—*Pontogenia nuda* Horst. *a*, ventral bristle  $\times 80$ , *b*, dorsal bristle  $\times 30$  *Lepidonotus dictyolepis* Haswell *c*, upper ventral seta  $\times 240$ , *d*, lower ventral seta  $\times 240$ , *e*, dorsal bristle  $\times 290$  (after Augener) *Laetmatonice producta* Grube. *f*, dorsal harpoon seta, *g*, ventral bristle, enlarged

No dorsal felt. Long skin papillae. 15 pairs of elytra. Paleae rather broad, faintly curved, showing two rows of cusps, lying at some distance from one another and cup-shaped. A dorsal fascicle of capillary setae. Teeth of the bifurcated apex of the ventral setae obtuse and short.

*Occurrence* Andaman Islands, Off Cape Negrais, Burma, 40 fms

*Remarks* *P. nuda* differs from the European *P. chrysocoma* in the absence of a dorsal felt and with its paleae more boldly serrated. They may be only varieties.

Subfamily *POLYNOINAE* Grube (Fig 12)

Body short, or rarely elongate      Elytra 12–18 pairs,  
 inserted on segments, 2, 4, 5, 7, 9,      23, 26, 29, etc.

Fig 12—*POLYNOINAE* Prostomium *a*, type *Lepidonotus*,  
*b*, type *Harmothoe*, *c*, type *Halosydna*; *d*, fringed and  
 tuberculate elytron, *e*, smooth elytron, *f*, front view  
 of the proboscis with papillae and  
 four jaws

For explanation of *at*, *ct*, *el*, and *pp* see fig 2, p. 5.

Prostomium bilobed, with 4 sessile eyes, 3 tentacles, 2 long  
 palps Proboscis with a row of terminal papillae and 4  
 horny jaws Feet biramous Setae all simple 2 anal  
 cirri.

*Key to the genera.*

### Genus *IPHIONE* Kinberg

Body short, oval. 13 pairs of elytra. Only two tentacles which are inserted laterally, facial tubercle present. Dorsal setae more slender than the ventral, which are unidentate.

#### 9 *Iphione muricata* Savigny (Fig. 13, a—e).

*Iphione muricata*, Seidler, 1922, p. 75 (Synonymy); Willey, 1905, p 246, pl I, fig 6. Gravely, 1927, p 4, pl IX, fig. 1; Pruvot, 1930, p 3, fig 1.  
*Iphione spinosa*, Michaelsen, 1892, p 5.

Body oval, flattened, entirely covered by the overlapping elytra. Prostomium square, with a deep anterior median notch, 4 eyes, 2 tentacles with a large basal part and a filiform tip. A facial tubercle. 13 pairs of elytra, uniform, deeply notched, their surface divided up into polygonal areas and these again into numerous secondary areoles. The posterior margin bears large spinous tubercles. Dorsal setae extremely fine, in dense clusters. Ventral setae stout, with a smooth curved tip.

Fig 13—*Iphione muricata* Savigny a, dorsal view, slightly enlarged, b, head, c, lateral papillae of the elytron, d, elytron's surface divided into areas, e, dorsal and f, ventral seta (after Gravier) *Lepidonotus carinulatus* Grube h, g, dorsal and ventral bristles, enlarged, i, elytron's papillae (after Grube) *L. jacksoni* Kinberg k, carinulate elytron's papillae, l, m, echinulate and stellate papillae (after Willey) *L. cristatus* Grube n, dorsal view (after Grube) *L. jukes* Baird o, p, two kinds of dorsal setae, q, ventral seta, r, elytron's papillae (after Pruvot) *L. hedleyi* Benham s, elytron's papillae, t, dorsal, u, ventral setae (after Pruvot)

*Length* 10–20 mm, by 6–10

*Colour* in life, pale fawn with deep blue border  
Brown in spirit.

*Occurrence.* Mergui, Andaman Islands, Ceylon, Maldivé Archipelago

*Distribution* Pacific and Indian oceans, the coasts of India, Red Sea

### Genus LEPIDONOTUS Leach

Body short Prostomium bilobed 4 eyes Paired tentacles short, terminally inserted Twelve pairs of elytra Dorsal setae spinous, more slender and shorter than the ventral, which are unidentate or bidentate, with a spinous enlargement at the base of the tip

*Key to the species of Lepidonotus.*

Elytra round, next oval and elliptic, fringed, covered with flat or carinulate tubercles Dorsal setae slender, spinulose, ventral setae stout, bidentate.

*Length* 15—30 mm On coral reefs and shells

*Occurrence* Ceylon, Tuticorin, Pamban, Shingle Island, Kilakarai.

*Distribution.* Japan, Philippine Islands, Indian Ocean, Persian Gulf, Red Sea, Madagascar

11 *Lepidonotus jacksoni* Kinberg (Fig. 13, k—m)

*Lepidonotus jacksoni*, Kinberg, 1857, p 11, pl III, fig 11, pl VIII, fig 48 Augener, 1922a, p 11, 1927, p 99 Seidler, 1924, p 74

*Lepidonotus carinulatus* (non Grube), Willey, 1905, p 248, pl I, fig 7—11

*Lepidonotus willeyi*, Benham, 1915, pl XXXVIII, figs 8—15

Elytra fringed, with flat, carinulate and large spheroidal echinate papillae, dorsal setae slender, ventral setae bidentate Elytra more conspicuously echinate or stellate than in *L. carinulatus*, but in both species there is a large range of variation in the number and size of the spinous tubercles Both are also closely allied to *L. squamatus* of Europe.

*Occurrence.* Port Blair Harbour, Andaman Islands, Ganjam Coast, Ceylon.

*Distribution* Pacific Ocean, New Zealand, Australia, Indian Ocean.

12. *Lepidonotus cristatus* Grube (Fig. 13, *n*)

*Lepidonotus cristatus*, Grube, 1878, p 27, pl II, fig 3 Gravier, 1901, p 270, pl VII, figs 104—110 Fauvel, 1919 p 329, 1932, p 15 Gravely, 1927, p 3, pl I, fig 2

*Lepidonotus oculatus* Baird, Seidler, 1924, p 43, figs 3—8

Elytra soft, large, entirely covering the back they are rounded or slightly emarginate, without fringe, covered with small stellate tubercles and bearing a large tumid, more or less bilobed crest Dorsal setae stout, crenulated, ventral setae with a short smooth apex and a few rows of small spines

*Occurrence* Andaman Islands, Gulf of Mannar, Ceylon

*Distribution* Philippine Islands, Amboina, West Australia, Indian Ocean, Mauritius, Zanzibar, Red Sea

13 *Lepidonotus hedleyi* Benham (Fig 13, *s, t* and *u*)

*Lepidonotus hedleyi*, Benham, 1915, p 181, pl XXXVIII, figs 1—7 Seidler, 1924, p 77 Pruvot, 1930, p 7, pl I, figs 6—10

Elytra oval, without fringe, smooth in appearance, pale grey, translucent, thin, slightly overlapping, sparsely covered with uniformly arranged low conical tubercles, which have an oval base Dorsal setae pale, all alike, with incomplete spiral frills Ventral setae with a sub-apical tooth and from 9 to 15 pectinate frills Tentacles smooth Dorsal cirri stout with a slight subterminal swelling (Benham)

*Length* 20 mm

*Colour* Dorsal cirri brown, with a dark band below the enlarged tip

*Occurrence.* Manora shore, Karachi.

*Distribution* New Caledonia, South Australia, Indian Ocean.

14 *Lepidonotus dictyolepis* Haswell

*Lepidonotus dictyolepis*, Haswell, 1883, p 287, pl IX, figs 7, 8 Seidler, 1924, p 25 Augener, 1927a, p 94, fig 3

Elytra oval, overlapping, entirely covering the back, and with a thick fringe and cylindrical papillae along

the margins, the surface is divided into polygonal areas, which may bear in their middle a round papilla with star-like diverging ridges and a central pore. Dorsal setae slender and spinulose. Ventral setae stout, with a short unidentate apex and a few spines.

**Colour:** A black triangular spot pointing forwards on the elytra.

**Occurrence** Shingle Island, Gulf of Mannar

**Distribution:** India, South Australia

15. *Lepidonotus tenuisetosus* (Gravier). (Fig 14, c—f)

*Lepidonotus tenuisetosus*, Fauvel, 1919, p 330, 1930, p 8, Seidler, 1924, p 25

*Euphione tenuisetosa*, Gravier, 1901, p 122, pl VIII, figs 123—125. Fauvel, 1911, p 368

Fig 14—*Hermenia acantholepis* (Grube) a, elytron, enlarged, b, ventral, trifurcate seta. *Lepidonotus tenuisetosus*, c, d, elytron's papillae, e, f, dorsal and ventral setae (after Gravier)

Elytra oval, slightly reniform, with a small fringe, covered with a few large and a number of smaller rounded

papillae, and also very small calicinate papillae on the outer edge. Dorsal setae slender, nearly capillary and spinulose. Ventral setae with a rather long smooth tip and a few fringes. Closely allied to *L. squamatus*, differs only in having more slender dorsal setae, smaller tubercles on the elytra and more closely placed eyes.

*Length* 15–30 mm

*Occurrence* Jack and Una Islands, Meigui Archipelago, Port Canning, off Puri, Orissa, Madras

*Distribution.* Indian Ocean, Persian Gulf, Red Sea, Madagascar.

16 *Lepidonotus melanogrammus* Haswell (Fig 9, a'–e')

*Lepidonotus melanogrammus*, Haswell, 1883, p. 284, pl. VIII, fig. 13. Fauvel, 1917, p. 176, pl. IV, figs. 18–19. Seidler, 1924, p. 84.

Elytra rounded, then oval, overlapping but leaving the middle of the back uncovered. They are smooth, without papillae or fringe, and are divided into polygonal areas. Dorsal ramus reduced to a small conical tubercle, with an aciculum. Ventral setae stout, bidentate, or unidentate in the posterior feet. Dorsal cirri short, with a large cirophore. Dorsal setae rare or wanting.

*Colour* Elytra dark, with two round spots. Dark spots on the ventral surface.

*Occurrence* Port Blair, Andaman Islands

*Distribution* Andaman Islands, South Australia

Sub-genus *THORMORA* Baird

Two kinds of dorsal setae

17. *Lepidonotus* (*Thormora*) *jukesi* (Baird). (Fig 13, o–r).

*Thormora jukesi*, Baird, 1865, p. 199

*Lepidonotus* (*Thormora*) *jukesi*, Seidler, 1924, p. 88. Fauvel, 1930, p. 508. Pruvot, 1930, p. 9, pl. I, figs. 11–15.

*Lepidonotus trissochaetus*, Grube, 1878, p. 25, pl. II, fig. 4. Fauvel, 1919, p. 332 (Synonymy)

Two kinds of dorsal setae. (1) short, curved, spinulose, (2) long, straight, smooth, slightly hastate. Ventral setae unidentate, with a few rows of spines. Elytra tough, rounded, overlapping, but leaving the middle of the back bare. They are destitute of any fringe and bear a few cylindrical, more or less starry, tubercles and smaller rounded ones.

*Occurrence* Mergui Archipelago, 3 fms, Andaman Islands

*Distribution* New-Caledonia, Australia, Malay Archipelago, Indian Ocean, Red Sea

*Incertae sedis*

18 *Lepidonotus fusicirrus* (Schmarda).

*Lepidonotus fusicirrus*, Seidler, 1924, p. 85

*Polynoe fusicirra*, Schmarda, 1861, p. 152, pl. XXXVI, fig. 311

Back convex Elytra 12 pairs, round, red, with brown and dark spots Tentacles and cirri smooth, fusiform, brown Dorsal setae long, capillary, sharp, with a tooth. Ventral setae, broad, with 2-3 spines under the unidentate tip

*Occurrence:* Ceylon

The description is too incomplete for an accurate identification

Genus *HERMENIA* Grube

Body short. Prostomium bilobed. 4 eyes Tentacles short, inserted terminally Twelve pairs of elytra, small, not overlapping Dorsal division of the foot rudimentary Ventral setae trifurcate

19 *Hermenia acantholepis* (Grube) (Fig 14, a, b).

*Hermenia acantholepis*, Seidler, 1924, p. 94 Pruvot, 1930, p. 11, pl. I, fig. 27-33

*Lepidonotus acantholepis*, Grube, 1878, p. 24, pl. II, fig. 1- Fauvel, 1922, p. 990, fig. 1, 1932, p. 16

Segments rough and warty. Elytra, with the exception of the first 2-3 pairs, very small, rounded, covered and bordered with large, brown ovoid tubercles and a few cylindrical papillae. Only a few dorsal setae, small, slender, serrated Ventral setae with two large conical teeth at the base of their large, faintly bent, tip

Although nearly related to the genus *Lepidonotus* the general appearance of the animal is very striking

*Length* 30 mm by 10 mm

*Colour.* uniformly milky with chestnut elytra.

*Occurrence.* Ceylon

*Distribution* Pacific Ocean, Samoa, New Caledonia, Australia, Annam, Philippine Islands, Malay Archipelago, Indian Ocean, Ceylon, Madagascar.

## Genus EUNOE Malmgren

Prostomium bilobed, with frontal peaks. Lateral tentacles inserted ventrally. Fifteen pairs of elytra, covering the whole body. Dorsal setae stout, with transverse rows of minute spines. Ventral setae unidentate.

20 *Eunoe pallida* (Ehlers). (Fig 17, c—g)

*Eunoe pallida*, Fauvel, 1931, p. 7, pl. I, figs 1—5

*Gattyana pallida*, Ehlers, 1908, p. 49, pl. I, figs 1—9

*Harmothoe pallida*, Horst, 1917, p. 91

?*Harmothoe holothuricola*, Izuka, 1912, p. 55, pl. VI, figs 2—7

Prostomium bilobed, with two small, short, pointed peaks. Median tentacle with a large, short ceratophore. Lateral tentacles filiform, shorter. 4 small pale-coloured eyes. Elytra 15 pairs, overlapping, large, soft, smooth, unfringed. Dorsal cirri with papillae. Dorsal tubercles present. Both divisions of the feet elongated, pointed. Dorsal setae stout, curved and serrated on the convex side. Ventral setae with a long, faintly spinulose, enlarged part and a smooth unidentate tip. The upper ventral setae are long, slender, straight, nearly capillary.

Parasitic on Echinoderms

*Length.* about 30 mm, by 9 mm

*Colour.* in spirit brownish

*Remarks.* It has sometimes been described with 16 pairs of elytra (Ehlers and Izuka).

*Occurrence.* Andaman Sea, Travancore, Persian Gulf.

*Distribution.* Japan (?), Malay Archipelago, Indian Ocean, Persian Gulf

## Genus GATTYANA McIntosh.

Prostomium with frontal peaks. Lateral tentacles inserted ventrally. Fifteen pairs of elytra covering the whole body. Dorsal setae numerous, spinulose, capillary. Ventral setae stout, unidentate.

21 *Gattyana deludens* Fauvel (Fig 15, 16).

*Gattyana deludens*, Fauvel, 1932, p. 18, figs 1, 2

Body elongate oval, nearly uniform in breadth, *much flattened*, 36—38 setigerous segments. Prostomium bilobed, frontal peaks blunt, 4 small black eyes. Elongate median tentacle, borne on a large ceratophore. Lateral tentacles filiform, much shorter, ciliated, inserted beneath

the base of the median tentacle      A nuchal fold      Paips tapering.      Tentacular cirri and tentacles with clavate

Fig 15—*Gattyana deludens* Fauvel *a*, anterior end, dorsal view, the head is supposed to be seen through the elytra which are really opaque,  $\times 7$ , *b*, elytron, arcuate patterns not figured  $\times 7$ , *c*, areolate part of the elytron on the smooth border, near the side  $\times 48$ , *d*, areolate part of the elytron near the fimbriate border  $\times 48$ , *e*, polygonal areas with raised cuticle and stomatiform spots  $\times 110$ , *f*, ventral cirrus  $\times 110$ , *g*, cirriferous foot  $\times 22$

papillae Dorsal cirri little exceeding the setae Ventral cirri short Cirriferous feet provided with a long gill-like dorsal process 15 pairs of elytra, yellow, tough, crossing and overlapping, covering the whole body. The first pairs orbicular, next reniform, fringed on the outer edge, upper surface smooth, divided into conspicuous polygonal areas, without any spines or papillae and without any secondary areoles in the meshes Dorsal ramus small, conical, with an enclosed aciculum and a number of white setae, long, slender, hair-like, with transverse rows of delicate spines and a finely tapering, undulating tip The superior dorsal setae are shorter, stouter, bent and denticulate. Ventral ramus larger, conical, with an enclosed aciculum and yellowish setae, larger, with a longer spinulose part slightly enlarged and a smooth unidentate tip 2 long papillated anal cirri.

Length 12–19 mm by 5–7 mm

*Colour:* in spirit elytra yellow, dorsal setae pale and ventral setae pale yellow.

Fig 16—*Gattyana deludens* Fauvel a, dorsal bristle  $\times 120$ , b, upper dorsal bristle, c, d, tip of upper ventral seta, side and front view  $\times 380$ , e, inferior ventral bristle  $\times 380$  f, inferior ventral bristle  $\times 150$ , g, median ventral bristle  $\times 150$ , h, upper ventral bristle  $\times 150$

*Remarks.* This species has externally the appearance of an *Iphonella*, *Iphonella cimex*, but it is really a *Gattyana*. *Harmothoe iphionelloides* Johnson (1901), which is also a *Gattyana*, is a closely allied species

*Occurrence* Annam; Poulo Condore, Mergui Archipelago, Gangetic Delta, Ghandipore, Balassore, Orissa, Pondicherry, Madras

### Genus LAGISCA Malmgren

Head as in *Harmothoe*, with lateral tentacles inserted ventrally. Fifteen pairs of elytra, leaving the posterior segments of the body uncovered. Dorsal setae stout, ventral setae bidentate

#### 22. *Lagisca flaccida* Potts (Fig 18, a—c)

*Lagisca flaccida*, Potts, 1909, p 339, pl XVII, fig 11. pl XVI figs 49—50, Horst, 1917, p 94

Body much flattened, breadth fairly uniform, tapering slightly just before the posterior end. Head hexagonal, with small distinct eyes and two tiny lateral peaks. Median tentacles long, lateral tentacles shorter, sparsely ciliate. A slight nuchal fold behind the head. Elytra soft, gelatinous, with the margins entire, the inner half covered with tiny tubercles. Dorsal setae with acute tip and a rather long smooth portion between it and the spiniferous area. Ventral setae long, with rather short spiniferous area and a short, rather blunt, spine under the incurved apex.

*Length.* 20 mm, by 6 mm.

*Colour* in spirit: elytra white.

*Occurrence* Ceylon.

*Distribution.* Malay Archipelago, Indian Ocean, Ceylon, Zanzibar

### Genus HARMOTHOE Kinberg

Prostomium bilobed, often with lateral peaks. 4 eyes. Lateral tentacles inserted ventrally. Fifteen pairs of scales, covering the whole dorsum. Dorsal setae stouter than the ventral, which are bidentate.

tentacles very short and slender. Tentacles and cirri papillated. 15 pairs of elytra, oval-reniform, sparsely fringed, with small conical tubercles and, often, a row of large globular papillae on the posterior border. Dorsal setae stout, slightly curved, serrated, with a smooth apex. Ventral setae spinulose, curved, the apex of which is smooth, bidentate with the secondary tooth curved outwards.

**Length:** 30–40 mm, by 10 mm

**Colour:** very variable, rather dark, sometimes pale with brown streaks

**Occurrence.** Krusadai Island

**Distribution** North Pacific, Japan, Petchili, Indian Ocean, Mediterranean Sea, Atlantic Ocean; Arctic Seas

24. *Harmothoe ampullifera* (Grube). (Fig 18, *d*).

*Harmothoe ampullifera*, Fauvel, 1911, p 368, 1932, p 22

*Polynoe ampullifera*, Grube, 1878, p 35, pl III, fig 5

*Lepidonotus ampulliferus*, Gravier, 1901, p 214, pl VII, figs 111-113

*Paralepidonotus ampulliferus*, Horst, 1917, p 76

Prostomium without frontal peaks, tentacles and cirri papillated Lateral tentacles inserted somewhat

Fig 18—*Lagisca flaccida* (Potts) a, posterior elytron, b, dorsal seta from the 6th segment  $\times 340$ , c, ventral seta of the 22nd segment  $\times 340$  (after Potts)  
*Harmothoe ampullifera* (Grube),  
d, elytron (after Gravier)

ventrally Elytra fringed, with small papillae and large vesicles in concentric rows. Dorsal setae arching, verticillate spinulose. Ventral setae bidentate Long nephridial papillae and conspicuous ventral lamellae Closely related to *H. imbricata*

Length 20-30 mm

Occurrence Singapore, Camorta Island, Rameswaram and Pamban coral reefs

Distribution Philippine Islands, Annam; India, Persian Gulf, Red Sea

25 *Harmothoe dictyophora* (Grube) (Fig 20, a-b, m)

*Harmothoe dictyophora*, Willey, 1905, p 251, pl 1, figs 14-16.

Fauvel, 1911, p 370, 1932, p 22, Gravelly, 1927, p 4

*Polynoe dictyophora*, Grube, 1878, p 44, pl XV, fig 9

Tentacles and curi papillated 15 pairs of elytra covering the back They are divided into polygonal areas carrying chitinous spines, simple or bifurcated, and filiform papillae Dorsal setae numerous, verticillate, spinulose Ventral setae conspicuously bidentate Very closely allied to *H. areolata* of Europe

Length 20–25 mm

Occurrence Ganjam Coast, Madras Presidency, Kilarai, from coral reefs

Distribution. Australia, Malay Archipelago, Annam, Bay of Bengal, Ceylon, Red Sea, Persian Gulf, Madagascar

26 *Harmothoe minuta* (Potts) (Fig 17a–b)

*Polynoë* (?) *minuta*, Potts, 1919, p 337, pl XIX, fig 12, pl XX, fig 31, pl XXI, figs 42, 43

*Lagisca minuta*, Horst, 1917, p 97

Fig 19—*Harmothoe imbricata* Linn: f, ventral seta  $\times 100$ , g, dorsal seta  $\times 100$ , h, head, enlarged, i, elytron, j, k, elytron's papillae, l, foot

[a–c refer to *Eunoe nodosa* not from India]

Prostomium bilobed, with acute frontal peaks 4 very small eyes Lateral tentacles very minute and slender 15 pairs of elytra, almost circular, translucent, with entire margin, smooth surface with delicate veins and occasional tiny chitinous tubercles Dorsal setae broad,

slightly curved with a rather blunt apex and serrations near the tip. Ventral setae numerous, with apex rather faintly serrated. Ventral setae numerous, with apex rather faintly serrated near the tip, not bearing recognisable spines, upper setae with a very long serrated region, a short incurved tip and projecting tooth just under it.

Commensal on Crinoids.

Length: 5 mm by 1.5 mm

Colour. Dark red or black.

Occurrence. Port Blair, Andaman Islands

Distribution: Andaman Sea, Maldivé Archipelago, Red Sea, Suez.

27. *Harmothoe arabica* Monro. (Fig 20, c-g).

*Harmothoe arabica*, Monro, 1937, p. 257, fig 5

Fig 20—*Harmothoe dictyophora* (Grube). a, elytron, b, elytron's marginal papillae, much enlarged, m, medio dorsal seta  
*H. arabica* Monro, c, head, d, foot, e, dorsal bristle, f, middle ventral seta, g, lower ventral seta (after Monro). *H. indica* Kinberg  
 h, i, ventral setae, k, dorsal seta (after Kinberg) *H. boholensis* (Grube),  
 l, elytron, enlarged

Prostomium bilobed, with acute frontal peaks. 4 small eyes, the anterior pair on the sides of the head

Median tentacle very short, piriform. Lateral tentacles stout. Subulate palps slightly longer. Tentacles and tentacular cirri papillated. 15 (?) pairs of elytra, round, smooth, with two patches of brown pigment. Dorsal bristles slender, slightly curved and quite smooth. Upper ventral bristles long, slender, unidentate and smooth, middle ones slender, spinous, faintly bidentate, lower ones shorter, faintly denticulated, with tip either simple or faintly notched. Differs from most *Harmothoe* in having dorsal and upper ventral setae smooth.

*Length.* 7 mm by 1 mm. 36 setigerous segments, ripe female.

*Occurrence.* Maldive area.

28. *Harmothoe indica* (Kinberg) (Fig. 20, *h-k*).

*Harmothoe indica*, Augener, 1922, p. 6, fig. 2, 1926, p. 442.

*Lepidonotus indicus*, Kinberg, 1857-1910, p. 15, pl. IV, fig. 19.

*Lagisca indica*, Potts, 1910, p. 338.

Prostomium without frontal peaks. Tentacles and cirri slender, papillated. Lateral tentacles inserted somewhat ventrally. A distinct nuchal fold. Elytra oval, entirely covering the back, overlapping considerably, firm, with granular appearance, with a broad crescentic mark of black pigment, covered densely with short, sharp spines and intermediately placed cilia and with short cilia on posterior and outer borders. Dorsal setae long, straight, anteriorly pointed, with numerous rows of spines. Ventral setae slender, with acute incurved tip, with a long slender spine situated just under it.

*Length.* 20 mm by 7 mm.

*Occurrence.* Ceylon.

*Distribution.* East Indies, Banka Strait, Ceylon, Chagos Archipelago, Salomon Island, Amirante Islands, 280 fms.

29. *Harmothoe boholensis* (Grube). (Fig. 20 *l*)

*Harmothoe boholensis*, Fauvel, 1911, p. 369, 1919, p. 332.

*Polynoë boholensis*, Grube, 1878, p. 41, pl. III, fig. 4.

*Paralepidonotus boholensis*, Horst, 1917, p. 77, pl. XVIII, figs 1-2.

Prostomium bilobed, with frontal peaks. 4 small eyes, the anterior pair slightly lateral. Median tentacle longer than the lateral which are shorter than the palps. Tentacles papillated, dark brown, faintly enlarged under the filiform tip. 15 pairs of elytra, first rounded, then

oval and next reniform, fringed, with conical or blunt tubercles and *divided crosswise into two pale and two dark areas*. Dorsal setae numerous, stout, verticillate, spinulose. Ventral setae bidentate. Nephridial papillae and ventral lamellae variably conspicuous.

*Length*. 30–35 mm by 11 mm

*Colour*. the dark maltese cross of the elytra is preserved in spirit.

*Occurrence*. Persian Gulf.

*Distribution*: Philippine Islands, Annam, Malay Archipelago, Persian Gulf, Red Sea, Madagascar

*Incertae sedis*

30 *Harmothoe sinagawensis* (*non* Izuka), Fauvel, 1932, p. 23, Fig. 3, pl. I, Fig. 1-2 (Fig. 21, *a*, *b*).

Under this doubtful name I have described a broken Polynoid, incomplete posteriorly. The elytra that remain

Fig. 21 —? *Harmothoe sinagawensis* Fauvel, *non* Izuka *a*, elytron,  $\times 40$  *b*, elytrigerousfoot,  $\times 40$  (from Fauvel, 1932)

are white with a transverse black streak, soft, destitute of fringe or tubercles. Tentacles and cirri papillated. The lateral tentacles, short, nearly pyriform, are subterminally inserted, somewhat as in *Halosydna*. The feet are long and tapering, with a dense cluster of very slender long capillary dorsal setae. The upper ventral setae are long, straight and spinous, the inferior ones have a short enlarged part with only few spines and a long smooth unidentate tip. Owing to the absence of the posterior part, the genus remains doubtful. I have since had the opportunity to observe *H. sinagawensis* specimens from Japan, which is a different species, with two kinds of dorsal setae and 16 pairs of elytra.

*Occurrence* Rameswaram Island, Madras Presidency.

### Genus SCALISETOSUS McIntosh

Body long, very brittle. Prostomium without frontal peaks. 4 eyes, three tentacles, the lateral ones inserted ventrally. Fifteen pairs of elytra thin, delicate, pellucid, not covering the whole body. Setae having the transparency of crystal. Dorsal setae, faintly curved, with some blunt spines on the convex border. Ventral setae hooked, bidentate with rows of semilunar cusps.

#### Key to the species of *Scalisetosus*

Ventral setae bidentate	<i>pellucidus</i> Ehlers, p. 49
Ventral setae unidentate	<i>longicirrus</i> Schmarda, p. 50

#### 31 *Scalisetosus pellucidus* Ehlers (Fig. 23, a-f)

*Scalisetosus pellucidus*, Fauvel, 1923, p. 74, fig. 27 (Synonymy), 1932, p. 24.

*Scalisetosus spec.*, Horst, 1917, p. 10, pl. XXI, figs. 8-10.

Body of moderate length. Elytra and cirri very easily detached. The anterior pair of eyes larger and wide apart. Tentacles and cirri with filiform tip and clavate papillae. Elytra round or oval, very transparent and delicate, with small cylindrical or clavate papillae, not fringed. Dorsal setae shorter than the ventral ones, curved, with several cusps on the convex side, and tip faintly bifid. Ventral setae with a short enlargement, a semilunar cusp, or spinous pouch, and a bidentate tip. On Echinoderms.

*Length:* 12-30 mm

F. 9

Colour Body translucent, yellowish, with a chequered brown pattern on the back Elytra dotted with white, yellow, pink or purple

Fig 22—*Scalisetosus longicirrus* (Schmarda) a, dorsal seta  $\times 363$ , b, inferior ventral seta  $\times 363$ , c, superior ventral seta  $\times 363$  (after Marenzeller) *Gastrolepidia clavigera* Schmarda d, head and first segment  $\times 9$ , e, dorsal seta  $\times 148$ , f, median ventral seta  $\times 148$ , *Allmaniella ptycholepis* (Grube) g, elytron  $\times 20$ , h, elytron's papillae, much enlarged (after Grube) *Hyperhalosydna striata* (Kinberg) i, ventral seta  $\times 8$  (after Grube), k, ventral seta *Admetella longipedata* McIntosh l, 28th foot  $\times 6$ , m, flattened seta  $\times 78$ , n, ventral seta  $\times 390$  (after Ehlers)

Occurrence Port Blair, Andaman Islands, Kilakara, S India, Maldives Archipelago.

Distribution Annam, Malay Archipelago, Bay of Bengal, Arabian Sea, Mediterranean Sea, Atlantic Ocean

- 32 *Scalisetosus longicirrus* (Schmarda) (Fig 22, a-c)  
*Scalisetosus longicirrus*, Marenzeller, 1902, p 574, pl III, fig 10  
*Polynoe longicirra*, Schmarda, 1861, p 152, pl XXXVI, fig 309  
*Polynoe crinoidicola*, Potts, 1910, p 337, pl 18, fig 10, pl 21, figs 39-41  
? *Halosydna ceylonica*, Willey, 1905, p 250, pl I, figs 12-13  
Body long, extremely fragile Prostomium composed

of two distinct halves 2 pairs of eyes, the anterior pair lateral Lateral tentacles inserted ventrally, slender and short. Elytra circular, smooth save for very minute tubercles, red or colourless in spirit (black when alive), covering the back, easily detached Dorsal cirri long Dorsal setae sabre-like, broad, slightly curved, with 2—3 serrations on the convex side under the acute tip Ventral setae with a semi-lunar cusp, apex incurved, with a small tooth, ventralmost setae stouter, with sharp incurved unidentate apex. All setae with the transparency of crystal Commensal on *Astropecten* and Crinoids

*Length* 13 mm

*Remarks* Though Willey attributes 24 pairs of elytra to his species, his description and figures fit very well with *Scalisetosus longicirrus* As the elytra were all wanting on his specimen he may have made an error regarding the number of elytra bearing segments

*Occurrence* Ceylon, Maldivé Archipelago

*Distribution* Japan, Indian Ocean

### Genus GASTROLEPIDIA Schmarda

More than 21 pairs of elytra, the arrangement of the posterior pairs irregularly alternating with the cirri Tentacles and cirri club-like, with a filiform tip *The sternum of the segments is provided with a foliaceous appendage on each side*

#### 33. *Gastrolepidia clavigera* Schmarda (Fig. 22, d—f)

*Gastrolepidia clavigera*, Schmarda, 1861, p 159, pl XXXVII, fig 315 Willey, 1905, p 258 Potts, 1909, p 341 Horst, 1917, p 84, pl XVI, fig 5 Seidler, 1924, p 142, figs 19, 20 Fauvel, 1919, p 335, 1932, p 25, 1942, p 25 Pruvot, 1930, p 13, pl I, figs 16—19

*Gastrolepidia amblyphyllus*, Grube, 1878, pl III, fig 7

Prostomium without frontal peaks Lateral tentacles inserted ventrally. Tentacles and dorsal cirri long and much enlarged distally, with a small filiform tip Elytra soft, without fringe or tubercles, semi-transparent, covering the whole back Dorsal setae few, stout, slightly curved and spinulose Ventral setae with unidentate tip Ventral lamellae very large and conspicuous Ectoparasitic on Holothurians

*Length* 25—30 mm

*Colour* Elytra all black or mottled dark brown and white.

**Occurrence** Andaman and Nicobar Islands, Ceylon, Rameswaram Island, Maldivé Archipelago

Fig 23—*Scalisetosus pellucidus* Ehlers a, head, enlarged (after Claparède), b, foot  $\times 20$ , c, elytron  $\times 12$ , d, elytron s papillae  $\times 109$ , e, ventral seta  $\times 310$ , f, dorsal seta  $\times 310$  (after McIntosh), g h, i, Sc *assimilis*

**Distribution** Pacific Ocean, New Caledonia, New Zealand, Indian Ocean, Bay of Bengal, Ceylon, Madagascar, Zanzibar.

### Genus HYPERHALOSYDNA Augener

About 50 segments More than 18 pairs of elytra. Lateral tentacles inserted terminally Dorsal setae few or absent Ventral setae bidentate Without ventral lamellae

#### 34 *Hyperhalosydna striata* (Kinberg) (Fig 22, i—k).

*Hyperhalosydna striata*, Seidler, 1924, p 136 (Synonymy) Fauvel, 1932, p 26

*Halosydna fulvovittata*, Horst, 1917, p 80

*Polynoë fulvovittata*, Grube, 1878, p 33, pl III, fig 1

*Polynoë platycirrus*, McIntosh, 1885, p 111, pl III, fig 4

*Lepidonotus striatus*, Kinberg, 1857, p 14, pl IV, fig 18

*Halosydna striata*, Monro, 1924, p 41, fig 4

Lateral tentacles as in *Lepidonotus*. Elytra 21-22 pairs, oval, with longitudinal dark stripes and 1-2 keels near posterior edge. Dorsal division of the foot reduced to a small process with only a few short, curved, serrated setae, often wanting. Ventral setae all alike and bidentate.

*Colour* Four or five longitudinal brown stripes on the elytra.

*Occurrence* Andaman Islands

*Distribution* Japan, Australia, Malay Archipelago, Indian Ocean

### Genus ALLMANIELLA McIntosh

Prostomium bilobed, with four large eyes. Lateral tentacles terminal. Fifteen (or more) pairs of elytra. Dorsal setae stouter than the ventral, which are bidentate.

#### 35 *Almaniella ptycholepis* (Grube) (Fig 22, g-h).

*Almaniella ptycholepis*, Horst, 1917, p. 79, pl. XXII, figs 6-9, Seidler, 1923, p. 151, Fauvel, 1932, p. 26.

*Polynoe ptycholepis*, Grube, 1878, p. 39, pl. II, fig. 6.

Head broader than long, divided into two rounded lobes with four large black eyes. Median tentacle long and slender, inserted on a ceratophore between the two lobes. Lateral tentacles filiform, shorter than the median and inserted on the frontal border. Palps twice as long as the lateral tentacles. Elytra 15-17 pairs, large, soft, translucent, smooth and without fringe. Parapodia with a long pointed ventral lobe. Dorsal lobe with a few setae, stout, curved, blunt, smooth, or very finely serrated. Upper ventral setae slender, nearly smooth, unidentate, median and lower setae enlarged, bidentate, nearly smooth or very finely serrated. Dorsal cirri long and slightly enlarged under the tip. Dorsal tubercles present. The shape of the head is very characteristic.

*Colour* Back striped brown and white, head brown.

*Occurrence* Andaman and Nicobar Islands, Nankauri Harbour.

*Distribution* Philippine Islands, Malay Archipelago, Bay of Bengal.

### Genus ADMETELLA McIntosh.

Body elongated, with 75 segments. 30 pairs of elytra. Head with the lateral corners elongated, triangular. Eyes absent (?). Both lobes of the parapodia with

an elongated distal extremity. Bristles long, vitreous (Horst)

36. *Admetella longipedata* McIntosh (Fig 22, l-n)

*Admetella longipedata*, McIntosh, 1885, p 124, pl XIV, fig 5, pl XX, fig 6, pl XIIA, fig 17 Augener, 1906, p 123 Ehlers, 1908, p 40, pl II, figs 10, 11, pl III, figs 1-5 Horst, 1917, p 101 Seidler, 1923, p 153 Fauvel, 1932, p 27

Prostomium with two rounded lobes and two thin triangular processes. Lateral tentacles inserted under the prostomial lobes Eyes absent Elytra 24-30 Parapodia very long, ending in a slender tip Dorsal and ventral setae long, delicate, translucent, flattened out in their distal part, finely serrated along both edges and ending in a smooth elongated tip Nephridial papillae very conspicuous.

*Length.* 50-60 mm by 28 mm.

Colourless in spirit

*Occurrence.* Andaman Sea, 279-569 fms

*Distribution.* Andaman Sea, Pater Noster Island, Indian Ocean, Somali Coast, West Indies

Genus *DRIESCHIA* Michaelsen

Body short with about 28 setigerous segments Head and tentacles as in the genus *Lepidonotus*, lateral tentacles inserted terminally Elytra thirteen pairs, on the segments 2, 4, 5, 7 21, 23 and 26 Parapodia sesquiramous Dorsal ramus reduced to an aciculum and a small achaetous lobe Ventral ramus with an aciculum and setae of two kinds. Setae of the first kind very slender, long, capilliform, other setae stouter, enlarged, and ornamented beneath the pointed tips

37. *Drieschia pelagica* Michaelsen (Fig 24)

*Drieschia pelagica*, Michaelsen, 1892, p 6, figs 15-18 Seidler, 1923, p 173 Fauvel, 1932, p 28, 1939, p 260  
*Nectochaeta caroli*, (non Fauvel), Monro, 1937, p 261

Prostomium divided into two long rounded lobes, with four small eyes, the anterior pair lateral The three tentacles are slender, with short ceratophores, the median is twice as long as the lateral ones, they are inserted terminally, somewhat resembling those of *Halosydna* The palps are curved and thick The two pairs of tentacular cirri are equal and elongated Elytra small, rounded, soft, translucent, with a few yellow grains, but without a fringe Dorsal cirri very variable in length but with en-

oimous cirrophores Feet long, ending in two unequal triangular lips Ventral cirrus filiform, shorter than the

Fig 24—*Drieschia pelagica* Michaelsen, var *caroli* a, anterior region  $\times 5$ , b, foot  $\times 16$ , c, d, e, f, ventral setae, upper one  $\times 109$ , middle ones, front and side view  $\times 187$

foot. Dorsal setae absent A dorsal aciculum and a small rudimentary knob. Ventral setae very long and slender accompanied by 2–4 much shorter and stouter setae with a short enlargement under the tip and a few rows of spines

Length 5–10 mm by 2–5 mm.

Colourless, translucent, pelagic

**Remarks** *Nectochaeta caroli* Fauvel is but an Atlantic variety of *Drieschia pelagica* with still larger cirrophores and more conspicuous dorsal knob

**Occurrence** Gulf of Oman, Ceylon Bay of Bengal

**Distribution.** Indo-China, Indian Ocean.

### Genus **NECTOCHAETA** Marenzeller

Body short, 15–35 setigerous segments Head and tentacles as in *Lepidonotus* Elytra 5–15 pairs on the segments 2, 4, 5, 7, 23, 26, 29, 32 Parapodia sub-biramous or sesquiramous Dorsal setae few, short Ventral setae long, spinous, unidentate or bidentate Pelagic and bathypelagic.

38 *Nectochaeta grimaldii* Marenzeller. (Fig 25)

*Nectochaeta grimaldii*, Fauvel, 1923, p 90, fig 34, a-i; Monro, 1937, p 261

Fig 25—*Nectochaeta grimaldii* Marenzeller a, anterior region  $\times 8$ , b, foot  $\times 23$ , c, clytron  $\times 23$ , d, tentacular seta  $\times 233$ , e, aciculum and dorsal seta  $\times 233$ , f, g, h, i, medium, inferior and upper ventral setae  $\times 109$ ,  $233$ ,  $109$

Prostomium bilobed 4 small black eyes Tentacles, tentacular cirri and palps very long and slender Dorsal cirri much longer than the feet Dorsal ramus reduced to an aciculum and a small knob with 1 or 2 very short dentate setae Ventral ramus long, with an anterior cirriform and posterior conical lips and dorsal and ventral rows of globular papillae Upper ventral setae slender, spinous, capillary, the inferior ones enlarged, bidentate. Translucent, planktonic.

Length 3–15 mm by 1–4 mm.

Remarks Very likely a young stage of *Lepidasthenia*

Occurrence Cental Arabian Sea

Distribution Arabian Sea, Mediterranean Sea, Atlantic Ocean.

## Genus LEPIDASTHENIA Malmgren

Body elongated, worm-like, segments numerous Lateral tentacles inserted terminally, as in *Lepidonotus* Elytra-bearing segments up to the end of the body Elytra

minute leaving the greater part of the back naked Dorsal ramus reduced to an aciculum and occasionally a few setae Ventral setae bidentate

*Key to the species of Lepidasthenia*

Elytra rather large Upper ventral setae slender *maculata* Potts, p 58

Elytra very small Ventral setae all alike equally stout *microlepis* Potts, p 57

39. *Lepidasthenia microlepis* Potts (Fig 26, e—f)

*Lepidasthenia microlepis*, Potts, 1910, p 343, pl XIX, fig 17, pl XIX, fig 52 Fauvel, 1930, p 510

Ventral setae large, yellow, all about the same size, the upper ones unidentate, the lower ones bidentate, at least in a variable number of segments Dorsal setae

Fig 26—*Hololepidella commensalis*, Willey a, b, c, dorsal, upper and inferior ventral setae, d, head and proboscis (after Willey), *Lepidasthenia microlepis* Potts e, head and anterior segments, f, ventral seta of the 15th segment  $\times 340$  (after Potts)

absent Elytra very small, hardly as broad as the elytophore, with the exception of the first pair They are marked by edging of brown or chocolate pigment Dorsum yellowish or, sometimes, with dark segments alternating with paler ones, somewhat as in *L. elegans* Dorsal curi stumpy.

*Length* 28–30 mm by 5 mm.

*Occurrence* Andaman Islands, on coral stones, Hulule, Male Atoll, Maldive Archipelago

*Distribution* New Caledonia, Malay Archipelago, Andaman Islands, Maldive Archipelago, Durban

40. *Lepidasthenia maculata* Potts (Fig 27, *h–k*)

*Lepidasthenia maculata*, Potts, 1909, p 344, pl XX, fig 33, pl XXI, fig 51 Fauvel, 1914b, p 71, 1923a, p 38, fig 33, *l–h*, 1932, p 29

Upper setae of the ventral bundle more slender than the rest Elytra relatively large, soft, destitute of fringe

Fig 27—*Lepidasthenia elegans*, Grube *a*, head, *b*, dorsal view, nat size, *c*, elytron  $\times 20$ , *d*, foot  $\times 20$ , *e*, stout ventral bristle  $\times 194$ , *f*, *g*, median and upper ventral setae  $\times 187$  (Red Sea)  
*L. maculata* Potts *h*, foot  $\times 23$ , *i*, *k*, median and upper ventral setae  $\times 187$

and papillae, 31 pairs Dorsal setae absent The dorsum is provided with black pigment flecks

var *striata* Fauvel

Fauvel, 1932, p 29

Tentacles slender, slightly unequal, a little enlarged under the tip Nuchal fold conspicuous Anterior pair of eyes large, the posterior pair smaller. The first dorsal

cirri are longer than the following ones. The rather large elytra leave about a third of the back naked and are rounded, soft, delicate, translucent, smooth, without either fringe or tubercles. Feet elongated, with two vertical, parallel, nearly equal, fillets. Dorsal cirri with big and short cirrophore, and cirrostyles slightly enlarged distally. In the median and posterior feet, the dorsal cirri are shorter, conical or fusiform. The dorsal ramus is reduced to a small knob with an enclosed aciculum. There are no giant setae in the ventral bundle. Two or three of the upper setae are more slender, with a long spiniferous area. The others are shorter and stouter, with transverse rows of spines and a bidentate apex.

*Length* 25–36 mm

*Colour* In the anterior part of the body a white segment is followed by three marked with seven dark stripes, further on a colourless segment is followed by two with five stripes. Each elytra bears a large dark spot.

*Occurrence* Mergui, enclosed in tubes of *Phyllochae-topterus*

*Distribution* of typical form Zanzibar, Morocco, Azores

### Genus HOLOLEPIDELLA Willey

Antennae arising at a lower level than the unpaired tentacle; segments and elytra numerous. Posterior elytra irregularly inserted. Parapodia biramous.

#### 41. *Hololepidella commensalis* Willey (Figs 26, a–d)

*Hololepidella commensalis*, Willey, 1905, p. 251, pl. I, figs 17–20. Fauvel, 1932, p. 30.

Body elongated, fifty segments or more. Prostomium bilobed, with short frontal peaks. Anterior eyes lateral, posterior eyes dorsal. Median tentacle slender, inserted on a short and broad ceratophore. Lateral tentacles small, pyriform, inserted ventrally as in *Harmothoe*. Nuchal fold not conspicuous. Dorsal cirri smooth, long, tapering, ventral cirri short. Elytra large, rounded, pale, delicate, translucent, overlapping and covering the back, they are destitute of either fringe or tubercles. There are at least 25–26 pairs, the last very irregularly alternating with the cirri. Dorsal tubercles conspicuous on the cirriferous feet. Dorsal setae few, curved, smooth or partly serrate, much shorter than the ventral setae.

Superior ventral setae slender, serrated, unidentate, inferior short, median with a faint subterminal spur and normal fringes of spines

*Length* 8 mm by 5 mm

*Colour* The back is brown and on the ventral side there are four longitudinal rows of brown spots Elytra colourless

*Occurrence* Mergui, Ceylon

### Subfamily *SIGALIONINAE* Grube

Body long and narrow, segments numerous 4 sessile eyes One or three tentacles Two palps Proboscis with a row of terminal papillae and four horny jaws Elytra numerous, inserted on alternate segments 2, 4, 5, 7, etc., and on each segment from the 23rd—29th up to the end of the body Cirriform dorsal gills Feet biramous Dorsal setae simple, ventral setae simple or compound Two anal cirri

Genus *STHENELAIS* Kinberg

A pair of ctenidia at the base of the median tentacle. Lateral tentacles fused with the first foot. Two long subulate palps, with ctenidia at the base. Scales covering the back, fringed. A branchial process on every foot from the fourth setigerous segment. Dorsal setae simple, capillary, tapering and spinous. Ventral setae compound, falcigerous and, sometimes, a few simple setae.

*Key to the species of Sthenelais*

*Sthenelais orientalis* Potts, 1910, p 348, pl 21, fig 62

Scales mostly reniform, crossing and overlapping over the back, with numerous minute papillae and a fringe on the outer border. Ventral ramus of the feet with 2—3 simple bipectinate setae. Compound setae with a short sickle-shaped appendix and a smooth shaft, others with a pluri-articulate appendix and, on the anterior feet, a few compound setae with a spinulose shaft. Three cup-shaped ctenidia above the dorsal division of the foot. Ventral division with stylodes and three bracts and a papillose ciliated frill. Ventral cirrus subulate.

*Length* 100—200 mm.

*Colour* Very variable, grey, yellow, brown, red

*Occurrence* Ceylon, Galle, Cape Comorin; Krusadai, Amiranti

*Distribution* Indian Ocean, Mediterranean Sea, Atlantic Ocean

43. *Sthenelais zeylanica* Willey (Fig. 29, a)

*Sthenelais zeylanica*, Willey, 1905, p 258, pl II, fig 48 Fauvel, 1927b, p 416, 1932, p 32

Differs from *Sth boa* in its ventral cirrus with two long tapering stylodes giving it a trifurcate appearance, in the absence of the parapodial frilled collars and in the compound bristles with fewer joints and shorter sickle-shaped tips. Simple bipectinate setae in the upper part of the ventral ramus are not always entirely absent, sometimes one may be found on a few posterior feet.

*Length*: 100—200 mm by 5 mm

*Colour*. Elytra dotted with small red-brown specks

*Occurrence*. Trincomalee, Kilakarai

*Distribution*: India

44. *Sthenelais variabilis* Potts. (Fig 29, b—d).

*Sthenelais variabilis* Potts, 1910, p 349, pl XIX, figs 22-23, pl XXI, fig 68

“Head with two pairs of eyes, both anteriorly placed, foremost and smaller quite lateral. Palps very long and slender, contrasting with shorter structures in *Sth orientalis* (= *Sth boa*). Head closely surrounded by succeeding segments, the first three having revolved almost at right angles. Elytra close, overlapping, uniform in shape,

except the first which is oval, and of a thin translucent nature. Only in one specimen from the Maldives (Hululu, Male, 25 fms) were any markings preserved on their surface, in this example a spot of white pigment over the elyrophore, and further inward a brown crescent surrounding a white spot. Male specimens, first elytron beset with a large, thick anterior margin. In succeeding elytra, margin ciliate, but degree of ciliation differing greatly in various forms. In some, cilia on greater part of border, and even developed on surface (var. *hirsuta*), in others, outer border only ciliate, and tubercles confined to small area of surface (var. *glabra*). Ventral setae in

Fig 29—*Sthenelais zeylanica* Willey a, foot (after Willey) *St variabilis* Potts, var. *glabra* b, posterior elytron, c, d, spinose ventral setae of the 15th segment  $\times 140$ , *St calcarea* Potts, e, elytron (after Potts)

following succession (1) Spinose simple setae, (2) slender type of compound setae, with long jointed appendix and spinose shaft, (3) stronger setae with smooth shaft and short appendix, (4) slender setae with smooth shaft and long jointed appendix. In first few segments all setae elongated, with long jointed appendices and setae of type (2) absent" (Potts)

*Length.* 28–37 mm. by 3.5–4 mm.

*Occurrence* var. *hirsuta*: Hululu, Male Atoll, Maldives var. *glabra* idem

*Distribution* Maldivé Archipelago, Zanzibar

45 *Sthenelais calcaria* Potts (Fig 29, e).

*Sthenelais calcaria*, Potts, 1910, p 349, pl XIX, fig 24

"Head provided with two pairs of eyes, both very small, anterior placed underneath on anterior border Ctenidia at sides of tentacle small. Elytra, save for the first which is oval, reniform, provided with cilia, which are moderately long on the outer border, very short on the posterior edge, alternation of shorter and longer taking place in a curiously irregular way. The surface covered with small equal tubercles, flat topped, with chitinous rims thickened on one side. In anterior region of elytron calcareous concretions cover surface, grains of all sizes occurring in connection with tubercles already mentioned, their curious granular nature indicating that they are true concretions. First elytron alone not possessing grains, though the tubercles more thickly placed there than in any other of the series. Parapodia rather resembling those in *Sth variabilis* in character. Upper division of ventral setae comprising spinose individuals both simple and compound." (Potts)

*Length* more than 57 mm by 35 mm

*Remarks* The encrusting particles are not foreign, but appear to be formed *in situ*.

*Occurrence* Goidu, Gofurfehendu Atoll, Maldivé Archipelago

Genus EUTHALENESSA Darboux

Median tentacle inserted between the prostomial lobes without ceratophore or ctenidia. Lateral tentacles inserted on the frontal margin. A dorsal cirrus on the third setigerous segment. A branchial process on every foot from the fourth setigerous segment. Elytra overlapping but leaving the middle of the back uncovered, they are fringed with multifid papillae. Dorsal setae spinous, simple. Ventral setae compound, falcigerous.

46 *Euthalenessa djiboutiensis* (Gravier) (Fig 30, a, b)

*Thalenessa djiboutiensis*, Gravier, 1901, p 231, pl VII, figs 114-117

*Euthalenessa djiboutiensis*, Fauvel, 1918, p 331, 1919, p 345, 1922, p 492, 1932, p 32

Three small conical tentacles all alike. Anterior pair of eyes large, posterior pair small. Dorsal cirrus on the third setigerous segment, with a large ceratophore and

a small tapering ceratostyle Elytra reniform, with long digitiform multifid papillae on the outer margin Three ctenidia on the dorsal division of the feet, numerous digitiform stylodes on the anterior feet, and foliaceous parapodial biacts on the others A dorsal tuft of

Fig 30—*Euthalenessa djiboutiensis* (Gravier) *a*, elytron, *b*, elytron's papillae, enlarged (after Gravier) *Eusigalion stylolepis* (Willey) *c*, head, *d*, elytron's marginal fimbriae, *e*, compound seta of the 60th segment (after Willey)

slender simple setae. Ventral setae compound, with a bidentate end-piece, simple or multi-articulate.

**Length** About 150 mm by 7–8 mm.

**Colour** In life pale yellow, marked with pigment spots In spirit, elytra with rusty spots

**Occurrence** Ceylon, off Puri, Orissa, Madras Coast, Mergui, Pedro Shoal.

**Distribution** Australia, Mergui, India, Persian Gulf, Red Sea

**Incertae sedis.**

*Thalenessa digitata* McIntosh, is an *Euthalenessa*, very close to *E. djiboutiensis* (Gravier), but the descriptions of Willey and Potts are too scanty to enable one to ascribe the specimens from Ceylon and the Maldives either to *E. digitata* or to *E. djiboutiensis*

**Genus EUSIGALION Augener**

Prostomium subtrapezoidal, with three subequal tentacles, a pair inserted near the anterior margin and a *median tentacle posterior to, or between the eyes* Four minute eyes dispersed in a rectangle on the dorsal side of the prostomium Elytra pedunculate, like those in *Sigalion*, with plumose fimbriae Cirriform branchiae under the elytra *they are wanting on the intervening segments*

**47 Eusigalion stylolepis (Willey) (Fig 30, c-e)**

*Thalenessa stylolepis*, Willey, 1905, p 261, pl III, figs 43-56

Prostomium large, flattened, shield-shaped, with three notches, two on the frontal border from which the paired antennae arise, one on the occipital border from which the *tentaculum impar* arises Two eyes, two pairs of tentacular cirri with setae and two long smooth filiform palps *Elytra pedunculate* Cirriform branchiae under the elytra, *absent on intervening segments* which have only a small tubercle No dorsal cirri The elytra carry 12-13 plumose fimbriae on the outer border and a small ctenidium on the inner side of each elytraphore Two dorsal ctenidia on each foot Dorsal setae long, simple, fringed Ventral superior bundle of simple whorled setae All the remaining ventral setae compound falcigerous with very long, many jointed, tapering bidentate appendices In the posterior feet, two stout setae with short sickle

*Length* 35 mm by 3 mm.

*Occurrence* Modragam Paar, Ceylon, out of coral block

**Genus PSAMMOLYCE Kinberg**

Body narrow and long, segments very numerous Median tentacle inserted on the anterior margin of the prostomium, without ctenidia Lateral tentacles fused with the first foot A dorsal cirrus on the third setiger-

ous segment A branchial cirriform process on every foot Elytra and back with adhesive papillae, densely coated with sand grains Dorsal setae simple, slender. Ventral setae compound, falcigerous

*Key to the species of Psammolyce*

*Psammolyce fijiensis*, McIntosh, 1885, p 148, pl XXI, fig 6, pl XXII, fig 4, pl XXIV, fig 6, pl XIII A, fig 28 Fauvel, 1932, p 33

First pair of elytra very large, prow-shaped, the others elongate oval, with anterior margin concave and slightly bilobed, but without any large club-like process, and anterior border beset with long adhesive papillae Dorsal cirrus of the third setigerous segment small and conical and tentacular cirri not swollen at the tip A transparent collar above the foot Dorsal setae plentiful, long, slender and serrated Ventral setae large, straight, all compound, differing very little from one another, with shaft more or less spinous, a terminal piece more or less elongate and always conspicuously bidentate. Ventral cirrus filiform Ventral papillae filiform, velvety. Deeply incrustated with sand grains

*Occurrence* Mergui Archipelago; 40 fms

*Distribution* Fiji Islands, Mergui Archipelago.

49. *Psammolyce antipoda* (Schmarda). (Fig 31, a-h).

*Pelogenia antipoda*, Schmarda, 1861, p 160, pl XXXVII, figs 320-322

*Psammolyce rigida*, Grube, 1878, p 55 (*pro parte*) Willey, 1905, p 256, pl II, figs 44-47

Elytra more or less rounded with anterior margin straight, or slightly concave, and a single club-like process, and posterior border beset with long adhesive papillae. Dorsal cirrus of the third setigerous segment rather long and bi-articulate and tentacular cirri not swollen at the tip A semi-circular collar above the foot Dorsal

setae slender, serrated. Ventral setae large, yellow, all compound, differing from one another, the upper ones with a spinose shaft, the upper and median with a short unidentate or bidentate terminal piece, the inferior ones with a long slender one. Ventral cirrus slightly enlarged below the tip. Filiform and rounded ventral papillae mixed.

Fig 31—*Psammolyce antipoda* (Schmarda) a, compound ventral seta of the 2nd segment  $\times 150$ , b, c, dorsal bristle from middle of body, front and side view  $\times 150$ , d, superior ventral compound seta  $\times 80$ , e, f, g, two median ventral setae from the same foot, one unidentate, the other bidentate  $\times 80$ , h, elytron  $\times 15$   
*Ps zeylanica* Willey, i, elytron (after Willey)

Length. 95 mm. by 9 mm.

Occurrence Ceylon, 10 miles off West Cheval Paa

Distribution Australia, New Zealand, Philippine Islands, Ceylon.

50. *Psammolyce zeylanica* Willey (Fig 31, i)

*Psammolyce zeylanica*, Willey, 1905, p. 255, pl. I, II, figs. 33–43  
*Psammolyce rigida*, Grube, 1868, p. 631, pl. VII, fig. 1 (pro parte).

Elytia triangular, with a straight anterior margin and two large club-like processes and a posterior border beset with long adhesive papillae. Dorsal cirrus of the third segment with terminal portion more slender and shorter than its peduncle, tentacular cirri shorter and not swollen. Dorsal setae capillary, finely plumose. Ventral compound setae with sub-elongate appendices, then a central group of stout setae with short appendices and an inferior group of slender setae with elongate appendices. Acuminate and globular papillae are mixed on the ventral surface, which is hairy.

*Occurrence* Ceylon

*Distribution* Red Sea (?), Ceylon

*Remarks* This species is very likely a variety of *Ps antipoda* (Schmarda). Under the name of *Ps nigida* Grube has described two different forms of *Psammolyce*.

### Genus LEANIRA Kinberg

Body narrow and long, segments very numerous. Median tentacle with a ceratophore and ctenidia. Lateral tentacles fused with the first foot. No dorsal cirrus on the third setigerous segment. A branchial cirriform process on every foot, from the fourth backwards. Elytia smooth or fringed. Dorsal setae simple, slender, serrated. Ventral setae compound, spinigerous, and, sometimes, a few simple bristles.

#### 51 *Leanira japonica* McIntosh. (Fig 33, a, b)

*Leanira japonica*, McIntosh, 1885, p 154, pl XXII, fig 8, pl XIVA, figs 1—2, Fauvel, 1932, p 33

*Leanira sibogae*, Horst, 1917, p 115, pl XXIV, figs 1—3

*Sthenolepis japonica*, Izuka, 1912, p 88, pl X, figs 3—7, Willey, 1905, p 259, pl II, fig 49

Prostomium with four black eyes and antennal ctenidia. On the third setigerous segment a small conical tubercle, but no true cirrus. Elytra smooth, unfringed, overlapping, leaving the mid-dorsum exposed. Dorsal setae numerous, long, slender and transversely fringed. Ventral setae compound, spinigerous, with a long, sharp pectinate-canaliculate terminal piece, and, occasionally, one or a few superior simple bristles provided with whorls of spikes.

*Length* 30—50 mm by 2 mm.

*Occurrence* Mergui, Andaman Islands, Bay of Bengal, Ceylon, Arabian Sea, Gulf of Oman.

A deep sea inhabitant, sometimes in shallow waters (Galle, in 7 fms).

*Distribution* Japan, Annam, Malay Seas; Indian Ocean.

### Subfamily ACOETINAE Grube.

Body elongate. Prostomium bilobed, with two large ommatophores (stalked eyes), or four sessile eyes. Three tentacles, the medium sometimes reduced to a small tubercle. Two long palps. Proboscis with papillae on the margin, median dorsal and ventral ones are tentaculi-form. Elytra on segments 2, 4, 5, 7, 9 and on every alternate succeeding segment. Feet biramous. Bristles simple. A spinning gland in the dorsal division of the feet.

### Genus POLYODONTES Renier.

Segments very numerous. Two large ommatophores (eye-stalks) and two small posterior sessile eyes. A median tentacle. Lateral tentacles inserted beneath the ommatophores. Two long palps. Four horny jaws. Proboscis bilobed. Two pairs of tentacular cirri with basal setae. Spinning glands in the feet. Branchial tubercles present on the feet. First foot little or not at all modified. Elytra leaving the back uncovered. Feet biramous, dorsal ramus small, with capillary setae. Ventral ramus large, thick, with three kinds of setae (1) serrulate, (2) aristate, (3) *serrulate subspiral*, genuine *bipennato-penicillate* setae absent.

*Polyodontes sibogae*, Horst, 1917, p 131, pl XXVIII, figs 4–10

*Acoetes magnifica*, Treadwell, 1929a, pp 1–4, figs 1–7

Ommatophores large, with black subspherical eyes on the extremity of clavate peduncles Two small eye-spots on each side of the prostomium Tentacles and palps with pigment spots First pair of elytra large, crossing and overlapping in front, flat, smooth, without fringe or pouch others with a narrow posterior pouch First foot slightly modified, elongated and pointing forwards Bladder-like branchial tubercles on a number of feet A dorsal geniculate, or sub-cylindrical, process above the base of the dorsal cirrus Spinning glands from the 8th foot backwards Dorsal ramus flattened, with a few capillary setae Ventral ramus large, thick, with

four kinds of setae (1) a bundle of slender setae enlarged above the shaft and serrulate, (2) pseudo-penicillate setae, (3) a vertical row of large yellow aristate setae, and (4) a bundle of *serrulate-subspiral* setae

Fig 33—*Leanira japonica* McIntosh a, camerated seta; b, bipeccinate seta *Polyodontes melanonotus* Ranzani c, head and proboscis, d, aristate seta, e, penicillate seta, f, superior ventral seta, g, inferior ventral seta (after Willey) *Eupanthalis edriophthalma* Potts h, anterior end, i, head (after Willey)

*Length.* Breadth, about 6 mm. (incomplete specimens).

*Occurrence.* Andaman Islands; Burma, off Tenasserim, and Arakan Coast, Ceylon; Gulf of Oman, 230 fms

*Distribution.* Philippine Islands, Malay Archipelago; Indian Ocean, Ceylon, Madagascar, Jamaica

Genus *PANTHALIS* Kinberg.

Body elongated Two large ommatophores (eye-stalks) A median tentacle Lateral tentacles inserted beneath the ommatophores Two long palps Four horny jaws Proboscis bilobed Two pairs of tentacular cirri Spinning glands in the feet. Branchial tubercles absent First foot modified Elytra flat, or with a posterior pouch Feet biramous, dorsal ramus small, with capillary setae, ventral ramus with setae of several types (1) serrulate, (2) bipennate-penicillate, (3) aristate, (4) serrulate-subspiral. A felt-like tube

54. *Panthalis oerstedii* Kinberg. (Fig 34, a-h).

*Panthalis oerstedii* Kinberg, 1857, p 25, pl VI, fig 34. Watson, 1895, p 169, pls IX-X Fauvel, 1914b, p 78, 1932, p 39, 1923, p 98, fig 38, a-h

Fig 34—*Panthalis oerstedii* Kinberg a, head, enlarged (after McIntosh), b, first foot (after Pruvot and Racovitza), c, foot  $\times 5$ , d, inferior ventral seta (serrulate-subspiral)  $\times 109$ , e, superior ventral penicillate seta  $\times 109$ , f, aristate seta  $\times 80$ , g, inferior ventral seta  $\times 109$ , h, elytron  $\times 4$  *Eupanthalis kinbergi* McIntosh i, head, enlarged, k, jaw, l, m, middle and posterior feet  $\times 5$ , n, penicillate seta  $\times 109$ , o, aristate seta  $\times 109$ , p, inferior ventral sigmoid seta  $\times 109$ , q, upper and lower proboscis' papillae, enlarged (This species is very like *E edrio phthalma* Potts, if not conspecific)

*Panthalis marenzelleri*, Pruvot and Racovitza, 1895, p. 412, pl. XIX, fig. 105; pl. XX, figs. 106–110

*Panthalis jogasimae*, Izuka, 1912, p. 68, pl. I, fig. 6, pl. VIII, figs. 1–6. Monro, 1928, p. 568

Size comparatively small. About 80 segments. Two large oval, or cylindrical, colourless ommatophores. Tentacles subulate. Two long tapering palps. Tentacles and cirri smooth. Proboscis with the median papilla elongated. Bases of the fangs denticulate. Facial tubercle absent. First elytra large, rounded, smooth, without fringe, overlapping in front, the others with posterior margin folded pocket-like. Branchial tubercles and dorsal processes absent. First foot modified, elongated, pointing forwards, with a heart-shaped foliaceous ventral ramus. Spinning glands from the 8th foot backwards. Dorsal ramus flattened, achaetous, ventral ramus compressed. Ventral setae of three kinds: (1) *bipennate-penicillate*, (2) a vertical row of aristate bristles, and (3) a bundle of *serrulate-subspiral* setae. In the anterior segments, preceding the spinning glands, setae similar to the lower ones take the place of the brush-shaped setae. A felt-like tube secreted by the spinning glands and coated with mud is always present.

*Length.* 40–100 mm by 8–10 mm.

*Colour in life.* Back pearly-white anteriorly, flesh coloured posteriorly. Elytra uncoloured, translucent.

*Remarks.* From deep dredgings on muddy or sandy bottom. 34–810 fms.

*Occurrence.* Off Burma, Andaman Islands; Bay of Bengal, Laccadive Sea,, Arabian Sea

*Distribution:* Pacific Ocean, Japan; Indian Ocean, Mediterranean Sea, Atlantic Ocean.

### Genus EUPANTHALIS McIntosh.

Body narrow, size moderate. Four *sessile* eyes, no ommatophores. A median tentacle. Lateral tentacles inserted at the end of the prostomial lobes. Two palps. Proboscis bilobed. Median dorsal and ventral papillae somewhat larger and lobed. Two pairs of tentacular cirri. Spinning glands in the feet. Branchial tubercles absent. Elytra flat. Feet biramous. Dorsal ramus achaetous (first feet excepted), ventral ramus thick, with three kinds of setae. (1) *serrulate*; (2) *aristate*; (3) *serrulate-subspiral*. A felt-like tube.

*Length:* 26 mm. by 5 mm.

*Elytra* colourless

*Occurrence:* Burma, off Akyab; Ceylon North of Negombo, 9 fms.

*Distribution:* Indian Ocean, Ceylon, Akyab

#### Family PISIONIDAE Levinsen

Prostomium without tentacles, fused with the buccal segment, the two pairs of cirri of which are directed forwards. Proboscis with four jaws. Feet uniramous. Dorsal and ventral cirri globular. Two anal cirri. Simple setae and compound falciform setae.

#### Genus PISIONE Grube

Body vermiform, segments numerous. Prostomium reduced, with eyes. Buccal segment with a pair of stout denticulate acicula, dorsal and ventral unequal cirri diverged forwards; the dorsal ones looking like tentacles and the ventral ones, stouter and longer, mimicking palps. Dorsal and ventral cirri globular. Feet long, with two lobes and two spines. Upper setae simple, lower ones compound, falciform.

56 *Pisone oerstedii* Grube (Fig 35)

*Pisone oerstedii*, Grube 1857, p 175 Levinson, 1886, p 292  
 Ehlers, 1900, p 257, 1901b, p 61, pl VI, figs 1-9 Augener,  
 1926, p 445 Fauvel, 1939, p 267, fig 2

*Pisone contracta*, Ehlers, 1901, p 64, pl VI, figs 10-18

Prostomium trapeziform, with four small eyes Proboscis crowned with short papillae, armed with two dorsal and two ventral hooks (as in *Polynoe*) Dorsal tentacle-like cilia of the buccal segment short and slender, with a basal globular papilla Ventral cilia much longer, mimicking palps Two large acicular spines, swollen in the middle and expanded at the tip, which is bevelled and

Fig 35 — *Pisone oerstedii* Grube a, anterior end  $\times 14$ , b, 23rd foot  $\times 31$  (after Ehlers), c, ventral bristle  $\times 390$ , d, swimming epitoxic bristle  $\times 390$ , e, 38-43rd segments of the male, with genital papillae,  $\times 39$

denticulate. Next segment, the first setigerous, with a long ventral cirrus directed forwards and a small globular dorsal one The dorsal cirrus of the second setigerous segment is long and slender, the ventral one globular Dorsal and ventral cirri globular on all the following segments Feet uniramous, with a median aciculum and a smaller superior one A single large simple seta and

3-4 inferior ones, which are stout, compound, with a short falcate, unidentate, terminal piece *Mature females* with a fascicle of 3-4 very slender transparent compound epitocous setae with paddle-shaped terminal piece, which are inserted between the upper and lower setae. No genital papillae apparent *Males*, with genital simple papillae and, when mature, multifid papillae and special organs on a number of segments, irregularly distributed

*Length* 20-40 mm by 2 mm

*Colourless* in spirit

*Occurrence* Ceylon

*Distribution* Pacific Ocean, Callas, Valparaiso, Indo-China, Indian Ocean, Ceylon

### Family CHRY SOPETALIDAE Ehlers

Body short, elongated, with few or numerous segments, bearing on their dorsal side a fan or a transverse row of paleae. Prostomium with four eyes and three tentacles. Two or four pairs of tentacular cirri. Feet biramous, with dorsal cirri on every segment. Ventral setae compound

### Genus CHRY SOPETALUM Ehlers

Body short, segments comparatively few. Prostomium oval, tentacles inserted on the prostomium. Two stout palps. First two segments partly fused, each carrying one pair of tentacular cirri. Next, dorsal ramus short, carrying only a fan of paleae which cover the greater part of the back. Stout dorsal cirri. Compound setae only on the ventral ramus

#### 57. *Chrysopetalum ehlersi* Gravier. (Fig 36, a-d).

*Chrysopetalum ehlersi*, Gravier, 1901, p 260, pl X, figs 150-151, Fauvel, 1939, p 266, Gravelly, 1927, p 5

Body short, very brittle. Median tentacle short, lateral tentacles pyriform. Four large eyes. A nuchal fold. First two setigerous segments with only dorsal paleae and no ventral setae. Dorsal cirri with a long ceratophore. Paleae slightly concave, broad, slightly enlarged under the pointed tip, with a row of teeth on each side. Ventral setae compound spinigerous, with a long striated shaft and a more or less long, slender, unidentate appendix

*Length* 6–15 mm by 1 mm.

*Colour*. Yellowish, with golden paleae

*Occurrence* Krusadai Island, Pamban

*Distribution* Pacific Ocean, Indo-China, Indian Ocean, Gulf of Mannar, Red Sea.

### Genus BHAWANIA Schmarda

Body elongated, vermiform, very brittle, with numerous segments Head very small, hidden Paleae arranged

Fig 36—*Chrysopetalum ehleisi* Gravier *a*, head, ventral side, enlarged, *b*, foot  $\times 64$ , *c*, bristle  $\times 191$ , *d*, palea  $\times 320$  *Bhawania cryptocephala* Gravier *e*, foot, enlarged  $\times 64$ , *f*, dorsal cirrus  $\times 255$ , *g*, palea  $\times 95$ , *h*, lower seta  $\times 320$ , *i*, upper seta  $\times 320$  (after Gravier)

in transverse rows. they are denticulated only along one side Ventral setae compound, of three kinds

#### 58 *Bhawania cryptocephala* Gravier (Fig 36, *e–i*)

*Bhawania cryptocephala*, Gravier, 1901, p 263, pl X, figs 152–156 Potts, 1909, p 328 Horst, 1917, p 137 Fauvel, 1919, p 347, 1932, p 43, 1939, p 266 Pruvot, 1930, p 20

? *Bhawania myrtolepis*, Schmarda, 1861, p 164, pl XXXVII, figs 323–325

Body yellow, twisted, very brittle, entirely covered by the paleae Head very small, hidden by the protruding anterior feet and the paleae, which are imbricated, arranged in dense transverse rows they are yellow or brown, oval-elongate, striated transversely and longitud-

inally, serrated on one side and show prominent ridges with a beaded edge Dorsal cirri digitiform, partly retractile Ventral ramus bearing (1) upper setae with long spinigerous terminal piece, (2) heterogomph falcigerous and (3) slender setae with an elongated smooth filiform appendix Ventral cirrus short The general appearance is like that of a *Sigalionid*

*Length* 80–100 mm. by 5 mm

*Occurrence* Burma coast, among sponges, Nicobar Islands, Nankauri Harbour, Camorta Island, Ceylon, Maldiva Archipelago

*Distribution* Pacific Ocean, New Caledonia, Philippine Islands, Indo-China Indian Ocean, Red Sea.

### Family AMPHINOMIDAE Savigny

Body elongated, square, or short, oval, depressed Prostomium deeply set into the anterior segments Three tentacles Two palpal pads with subulate palpostyles (resembling a second pair of lateral tentacles) A caruncle Parapodia biramous, with branchiae, one or two dorsal cirri on each side, a ventral cirrus (exceptionally uniramous with compound hooks). Setae simple, straight or furcate Proboscis unarmed

 bristle  $\times 140$ , f, dorsal harpooned bristle  $\times 140$ , g, dorsal,  
 spinous bristle  $\times 140$

*Amphinome pallasii*, Quatrefages, 1865, p 344 Fauvel, 1914b, p 85 (Bibliography), 1923, p 128, fig 46, a-g

*Pleione tetraedra*, Milne-Edwards, 1849, pl VII, fig 1

Body square in section Prostomium small, rounded, with two eyes Caruncle smooth or slightly plaited Median tentacle short, inserted on the anterior margin of the caruncle Lateral tentacles short, subulate Palps conical. Bushy gills from the 2nd or 3rd setigerous segment. Dorsal cirrus inserted under the branchial cluster Dorsal setae of two kinds. (1) long, slender, more or less serrated at the tip, (2) stouter bristles with lateral fangs (glochudiate setae, harpoon-shaped). Ventral setae few, 5-7 uncinata. Acicula with a terminal knob. On floating wrecks, amongst the *Lepas*.

*Length* 200-400 mm. by 20-30 mm

*Colour*. Body bluish-grey, cirri and gills red (rusty yellow in spirit).

*Occurrence*. Andaman Sea. 112 fms, Nankauri Harbour, on a drifting log, Puri, Orissa

*Distribution*. Pacific, Indian, and Atlantic Oceans, in their warm parts.

*Remarks* *A. rostrata* and *A. pallasii* are synonymous A careful comparison of specimens from Indian and Atlantic Oceans has failed to reveal any specific differences.

### Genus EURYTHOE Kinberg.

Body elongate, square in section. Prostomium large, rounded, with four eyes Three subulate tentacles, two large pad-like palpophores with subulate tentacle-like palpostyles Caruncle consisting of a sinuous crest with vertical folds along its lateral sides Branchiae ramified, mostly bifid, generally short and thick. Dorsal setae usually longer, of three kinds. (1) bifid, the shorter arm being a spur, (2) harpoon-shaped, (3) sword-shaped. Acicula lanceolate Anus dorsal, extending over several segments or terminal.

#### *Key to the species of Eurythoe.*

Branchiae commencing on the second segment Four very conspicuous eyes. Caruncle terminating on third or fourth segment, lateral lobes more or less hidden in

Fig 38—*Eurythoe matthai* Bindra a, head and first segment  $\times 16$  (after Bindra) *E. complanata* (Pallas), b, head and anterior segments, c, foot, d, dorsal view of anal region (after Gravier), e, ventral bristle, f, dorsal bristle  $\times 333$ , m, harpooned bristle  $\times 333$  *E. parvecarunculata* Horst, e, anterior region, f, aciculum (after Horst), g, ventral bristle, h-i, dorsal bristles

grooves under the smooth lobe About five buccal segments Dorsal setae very variable in length, of three kinds: (1) long calcareous setae, with an elongate slen-

dei tip, more or less serrated, and a small spur at the base, (2) large straight, harpooned, glochidiate setae, with lateral rows of easily deciduous teeth, and (3) stout, straight, *smooth* setae. Two kinds of ventral setae: (1) stout furcate setae with unequal arms, the larger one smooth, or slightly serrated on young specimens, and (2) a few sub-furcate setae with one of the arms thin and greatly elongated. Acucula short, spear-headed.

*Length* 50–200 mm by 10–15 mm

*Colour* Gills red, setae alabaster-white.

*Occurrence:* Meigu, Andaman Islands, India, Ceylon, Maldive Archipelago, Arabian Sea

*Distribution* On coral reefs of the whole tropical area of Pacific, Indian and Atlantic Oceans

*Remarks.* The setae, in life, are very brittle, and consequently vary much in length, according to the environment. As they are calcareous, they are often damaged in spirit, formol and other reagents, becoming soft, woolly and losing their lateral teeth. Moreover, many specimens, having undergone regenerations which are very frequent in this species, present marked modifications in the proportions and appearances of the head, the number of buccal and anal segments, the shape of the body, of the anal funnel, and the length of the tentacles. Contraction, due to the fixatives, also alters the appearance of the caruncle to a large extent. Such is the explanation of its having been described under so many names (See Fauvel, 1943a, p. 5).

# 61 *Eurythoe matthaei* Bindra (Fig 38, a)

*Eurythoe matthaei*, Bindra, 1927, p. 12, pl. II, figs 4–5

Body rectangular in cross section. Branchiae beginning on the first segment. Buccal segments four. Caruncle oval, extending over the first two segments. Anus terminal. Median tentacle shorter than the paired tentacles. Eyes hidden by the anterior margin of the caruncle, anterior ones larger than the posterior. Harpoon-shaped setae well developed, reaching the length of the bifid setae.

*Length* 65–110 mm by 5–8 mm

*Occurrence* Karachi.

*Distribution* India

62 *Eurythoe parvecarunculata* Horst (Fig 38, c-1)

*Eurythoe parvecarunculata*, Horst, 1912, p 37, pl X, figs 1-5

 1923, p 9, 1927, p 325, fig 1, 1932, p 46

? *Amphinome djiboutiensis*, Gravier, 1901, p 245, figs 249-253,  
 pl IX, figs 137-139

? *Amphinome maldivensis*, Potts, 1909, p 263, pl XLV, figs 14-15,  
 pl XLVI, figs 12-17

*Eurythoe heterotricha*, Potts, 1909, p 369, pl XLV, figs 16-17,  
 pl XLVI, figs 18-19

Branchiae commencing on the third segment. Rounded cephalic lobe with a large heart-shaped palpal part and four eyes, upon its posterior border it bears a long unpaired antenna, the two anterior antennae are much shorter. The subulate palpo-styles of the palps are somewhat shorter than the lateral antennae. The caruncle is a small oval process only extending over the first segment. The strongly ramified branchiae are most developed in the anterior part of the body, decreasing posteriorly. The acicula have an elongated oval tip. Dorsal setae of two kinds (1) slender elongated, bifurcated, with a long limb smooth or coarsely denticulated along its internal border, and a short limb often reduced to a mere spur, and (2) short, stout, harpoon-shaped bristles. Ventral setae fuscate, with the longer limb bent backwards and provided with a few faint denticulations. They are associated with a few slender elongate setae with a spur-like short limb and a long limb smooth, or faintly denticulate.

*Length* 30-220 mm by 3-14 mm.

*Occurrence* Port Blair, Andamans, Chilka Lake

*Distribution* Malay Archipelago, Bay of Bengal, India, Atlantic Ocean, Cameroon, Guiana, ? Red Sea, Maldives

*Remarks* If *Amphinome djiboutiensis* Gravier and *A. maldivensis* Potts, which really belong to the genus *Eurythoe*, be also conspecific with *E. parvecarunculata* Horst, Gravier's name should have priority.

## Genus PSEUDEURYTHOE Fauvel

Body elongated, square in cross-section of the anterior part. Prostomium rounded. Two pairs of eyes. Caruncle reduced to a small knob, deeply set into the first segment. Three tentacles. Palps cushion-like, with subu-

late palpostyles Feet binamous, with dorsal and ventral divisions far apart. Dorsal setae of two kinds (1) harpoon-shaped, (2) capillary Ventral setae (1) short, bifurcate, (2) capillary, with or without a short basal spur Each foot bearing a dorsal and a ventral cirrus  
*Gill-tufts limited to the anterior part of the body*

*Remarks* This genus is a connecting link between *Eurythoe* and *Paramphinome*.

*Key to species of Pseudeurythoe.*

*Pseudeurythoe paucibranchiata*, Fauvel, 1932, p 48, fig 8, pl I, figs 3-4

Body more or less moniliform posteriorly. Prostomium globular, slightly bilobed anteriorly, raised posteriorly into a heart-shaped lobe Lateral tentacles articulate Median tentacle inserted at the back of the heart-shaped lobe which bears two small, inconspicuous eyes on its anterior border Caruncle reduced to a very small lobe, set into the first setigerous segment Palps cushion-like, with articulate palpostyles Branchiae from the 3rd setigerous segment to the 25th, in clusters of filaments Dorsal setae (1) long capillary without spur (2) short slender capillary, (3) stout, harpoon-shaped Ventral setae (1) upper trifurcate, serrated, with long spur, (2) very long smooth capillary, without spur, (3) furcate, with long limb serrated

*Length* 25 mm. by 2 mm

*Occurrence* Ain Musa, Gulf of Suez

Fig 39 — *Pseudeurythoe paucibranchiata* Fauvel *a*, head,  $\times 18$ , *b* branchiferous foot  $\times 40$  (from Fauvel, 1932).

*Pseudeurythoe microcephala*, Fauvel, 1932, p 49, fig 9, pl. I, figs 5—8

Body moniliform posteriorly. Head very small, entirely retracted into the first segment. Prostomium longer than broad, rounded anteriorly, enlarged and quadrangular posteriorly. Caruncle square, very small, deeply

Fig 41—*Pseudeurythoe microcephala* Fauvel a, head  $\times 20$ , b, foot from the middle of the body, male  $\times 40$ , c, branchiferous foot, male,  $\times 40$ , d, foot from the middle part of the body, female,  $\times 40$

hidden under the protruding border of the next segment. Two pairs of reddish eyes. Median tentacle filiform, inserted far back between the posterior eyes. Lateral tentacles subulate, faintly articulated. Palpostyles about the same length. No hooks on the first setigerous segments. Branchiae from the 3rd setigerous segment to the 25th, they are bushy. Dorsal setae: (1) long, slender, smooth, capillary, without spur, (2) harpoon-shaped

Ventral setae (1) long, serrated, capillary, without spur,  
(2) furcate with longer limb boldly serrated

Fig 42—*Pseudeurythoe microcephala* Fauvel *a*, smooth dorsal bristle  $\times 380$ , *b*, serrated capillary ventral bristle  $\times 530$ , *c*, *d*, furcate ventral bristles  $\times 530$ , *e*, harpoon-shaped bristle  $\times 380$

Differs from *P. paucibranchiata* Fauvel chiefly by:  
(1) head very small, (2) prostomium sunk, (3) absence of basal spur on long setae of both rami.

*Length* 30 mm by 2 mm

*Occurrence* From reef-flat between Hululū and Heratera, Addu Atoll, Maldives Archipelago.

65. *Pseudeurythoe acarunculata* Monro (Fig 43, *d–m*)

*Pseudeurythoe acarunculata*, Monro, 1937, p 249, fig 2

Body slender and vermiform. Head deeply retracted into the first segments, more or less rectangular in outline and divided into two regions by a transverse groove. The hinder part of the prostomium is slightly broader than long and cut off squarely behind. No trace of a caruncle is visible. A kind of nuchal pit present. Two pairs of eyes. The median tentacle on a level with the posterior

pair, the lateral tentacles just before the anterior pair. Palpostyles lateral. *No hooks on the first setigerous segment.* Branchiae from the 4th setigerous segment to about the 50th they are bushy. A long dorsal cirrus. Dorsal setae (1) very fine, smooth, capillary bristles, (2) harpoon-shaped. Ventral setae. (1) very long capillary bristles, with a smooth spur, (2) short, stout, furcate bristles with the longer limb serrated (no long ventral capillary without spur)

*Length.* 30 mm by 1 mm.

*Occurrence.* Maldive Archipelago

66 *Pseudeurythoe ambigua* Monro (Fig 43, *i—m*)

*Pseudeurythoe ambigua*, Monro, 1937, p 251, fig 3

Shape slender and vermiform, tapering rather sharply in front and gradually behind. Head rounded in front,

Fig 43—*Benthoscolex coecus* Horst a, dorsal view of anterior segments  $\times 16$ , b, short ventral bristle  $\times 191$ , c, elongated ventral bristle  $\times 191$  (after Horst) *Pseudeurythoe acarunculata* Monro d, anterior end from above, e, f, dorsal bristles g, short ventral bristle, h, fine ventral bristle *Ps ambigua* Monro i, anterior end, from above, eyes not shown, k, dorsal bristle, l, m, ventral bristles (after Monro)

divided into two regions by a transverse groove running a little way behind the lateral tentacles, and more or less rectangular, broader than long behind the hinder part is not heart-shaped as in *Ps paucibranchiata* Fauvel. The

caruncle is a rounded pad lying in the first chaetiger. Two pairs of minute, inconspicuous eyes. Branchiae from the 3rd setigerous segment to the 43rd, large and conspicuous. Dorsal cirri long. Dorsal setae (1) long, smooth capillary, (2) harpoon-shaped. Ventral setae (1) upper bifurcate, with long spur, (2) very long capillary, (3) stout short furcate, with longer limb serrated. (Bristles as in *Ps paucibranchiata*.)

*Length* up to 47 mm by 2 mm

*Occurrence.* Maldivé Archipelago

*Distribution.* Gulf of Panama, Maldivé Archipelago.

### Genus PARAMPHINOME Sars

Body moderately elongate, vermiform, segments few. Prostomium rounded, no eyes. Caruncle small. Three tentacles. Palps cushion-like, with subulate palpostyles. Feet biramous, with dorsal and ventral divisions far apart. Dorsal setae of two kinds: (1) harpoon-shaped and (2) capillary. Ventral setae also of two kinds (1) short, bifurcate, and (2) long, capillary, with, or without, basal spur. Acicula hastate. *Two strong curved hooks on each side of the first setigerous segment.* Gills only on anterior segments. Anus terminal.

#### 67. *Paramphinome indica* Fauvel (Figs 44, a–h, 45 a–f).

*Paramphinome indica*, Fauvel, 1932, p. 51, text-fig. 10, pl. I, figs 9–16

Body cylindrical, slightly flattened anteriorly. Prostomium eyeless, globular, rounded anteriorly, very slightly bilobed backwards, with a very small oval or triangular caruncle set into the first segment. Two filiform lateral tentacles, median tentacle long, raised, inserted at the back. Palpostyles tentacle-like. On the first setigerous segment a long dorsal cirrus and a slightly shorter ventral one, and, in front of the setae, *two strong, curved, transparent hooks.* No ventral cirrus on the second setigerous segment. On the third and the following ones both a dorsal and a ventral cirrus. Branchiae 10–13 pairs, from the 4th setigerous to the 13th–16th, they are very large, entirely covering the body and feet, divided into many branches bearing lateral filaments, simple or bifurcate. Both rami wide apart. In the posterior abbranchiate region, of 10–13 segments, a short blunt dorsal process, with a long cirrus and a tuft of capillary setae, a larger ventral

ramus with two fillets, an anterior conical, and a posterior rounded, a little shorter, a ventral cirrus and very long setae. Dorsal setae of two kinds (1) large, straight, harpoon-shaped bristles, (2) long and slender capillary. Ventral setae also of two types (1) short, with tip of the shaft bifurcate, one of the limbs large, curved, serrated,

Fig 44—*Paramphinode indica* Fauvel a, dorsal view  $\times 3$ , b, anterior end, dorsal view  $\times 7$ , c, head, ventral view  $\times 7$ , d, proboscis extruded  $\times 7$ , e, proboscis extruded, side view  $\times 7$ , f, third setigerous foot  $\times 25$ , g, second setigerous foot  $\times 25$ , h, hooks from 1st setigerous foot  $\times 185$

the other much smaller, slender and smooth, and (2) longer and slender serrate setae, with a small basal spur. Acicula hastate. Anus terminal

Length 15–20 mm by 4–5 mm.

Colourless in spirit

Occurrence. Arabian Sea, 530 fms, Cape Comorin 881–891 fms Green mud

## Genus BENTHOSCOLEX Horst.

Body oblong oval, agreeing in general appearance with that of *Chloeia*. Caruncle short, with three parallel longitudinal ridges. Eyes absent. Branchiae commencing on the 6th segment, strongly developed on the posterior segments. Furcate bristles. An unpaired anal cirrus (Hoist).

68 *Benthoscolex caecus* Hoist (Fig 43, a-c)

*Benthoscolex caecus*, Horst, 1912, p 38, pl X, figs 11-16

Body tapering in front and behind. Prostomium small, heart-shaped, with a short caruncle consisting of

Fig 45—*Paramphnومه indica* Fauvel a, large dorsal smooth bristle  $\times 150$ , b, harpoon-shaped bristle from hind foot  $\times 380$ , c, furcate ventral bristle from 3rd setigerous segment  $\times 380$ , d, furcate ventral bristle  $\times 380$ , e, acicular bristle  $\times 380$ , f, slender, furcate capillary seta  $\times 380$

three longitudinal ridges, that do not extend beyond the first segment. No eyes present. A median, tentacle in front. Lateral tentacles nearly as long as the median one, set on each side of the median dorsal line. Cushion-like palpophores with tentacle-like palpostyles. An unpaired

anal papilla, faintly emarginated and a subterminal dorsal anus. Well developed branchiae from the 6th segment, in dense clusters of numerous filaments, on the last 5—6 segments they are more numerous, crossing over the back and forming large bushy terminal clusters. Dorsal cirri about the length of the setae, ventral cirri shorter, with the exception of the last 3—4 ones which are filiform and very long. Dorsal and ventral bundles of bristles stiff and alabaster-white. Ventral ramus with only bifurcated setae as follows (1) with a long limb, plain, or with 1—3 denticulations, and a short limb, like a spine, and (2) much more slender setae with a long limb, coarsely denticulated, and a short limb like a spur. Dorsal setae alike, but fewer and shorter and mixed with harpoon-shaped ones.

*Length* 34—37 mm by 10 mm

*Occurrence* Ceylon; Laccadive Sea

*Distribution* Flores Sea; Ceylon, Laccadive Sea.

### Genus CHLOEIA Savigny

Body oval, caruncle composed of a plaited crest, arising from a horizontal plate, folded along its margin. *Pinnate branchiae*. All bristles more or less bifurcated, the ventral ones smooth, those of the dorsal fascicle, in some anterior segments, smooth, in those of the posterior body-region, serrated along the outer border. Two anal cirri sausage- or finger-shaped. Anus in the last segment. Only one pair of dorsal cirri on each segment.

### Key to the species of *Chloeia*

*Chloeia tumida*, Baird, 1870, p 232, pl IV, fig 7, a-d

Median dorsal purple spots varying in shape from a narrow ellipse to a circle Setae varying from almost pure white to a bright yellow or pale green Tentacles and dorsal cirri more or less violet or deep purple Branchiae unpigmented or brown Caruncle extends posteriorly to the commencement of the 4th segment and ends with a free tapering extremity

Length 100-120 mm by 4 mm

Occurrence Singapore; Andaman Islands; Bay of Bengal, Ceylon, Mandapam, Palk Strait At Port Blair caught on a fishing line, on hooks baited with meat Feeds on small crabs, etc

Distribution Japan, Pacific and Indian Oceans

71 *Chloeia parva* Baird (Fig 46, f)

- Chloeia parva*, Baird, 1870, p 233, pl IV, fig 8, d-b Horst, 1912, p 19, pl VII, fig 4, pl VIII, figs 1-3 Fauvel, 1932, p 56  
*Chloeia merguensis*, Beddard, 1887, p 258, pl XXI, figs 2, 8, 9

Body tapering posteriorly Along the centre of the back, on each segment, there is a dark mark in shape somewhat like the Roman T, or rather the Greek Y The caruncle extends to the anterior part of the 6th segment and its crest is surmounted with a black wavy line

Length 20-70 mm

Occurrence Penang, Andaman Islands, Sandheads, Mouth of Hughli River, Chandipur, Balasore, Orissa, Vizagapatam, Ceylon

Distribution Pacific Ocean, New Guinea, Java, Indian Ocean, Sumatra, Mergui, Andaman Islands, West Coast of India, Gulf of Oman

72 *Chloeia amphora* Horst (Fig. 46, c)

- Chloeia amphora*, Horst, 1912, p 21, pl VII, fig 6, pl VIII, figs 6-7 Fauvel, 1932, p 56

Each segment shows in the middle a violet spot, somewhat resembling a roman *Amphora*, surrounded by a white band. The dorsal cirri are dark-violet, the ventral ones colourless. The caruncle bears about 20 lateral folds and extends to the anterior border of the 4th segment (Horst)

*Length* 16–26 mm by 7 mm, without the bristles  
26 segments

*Occurrence* Port Blau, Andaman Islands, Nankauri Harbour, Octavia Bay, Nicobar Islands

*Distribution* Malay Archipelago, Andaman and Nicobar Islands

### 73. *Chloeia fusca* McIntosh (Fig 46, d)

*Chloeia fusca*, McIntosh, 1885, p 14, pl II, figs 1–2 Potts, 1909, p 356, pl XLV, figs 1–2 Horst, 1912, p 22, pl VII, fig 7  
Monro, 1924, p 72 Fauvel, 1932, p 56

*Chloeia longisetosa*, Potts, 1909, p 357, pl. XLV, fig 5

Back uniformly dusky brown, or purple-violet, or pale ground colour with a couple of longitudinal purple stripes near the dorsal middle line. Beneath each dorsal bundle of bristles is a purple ring shading off into orange, the dorsal cirri are dark-purple

*Remarks* *Chloeia longisetosa* is the epitocous state of *Ch fusca*

*Length*: 10–20 mm by 4 mm

*Occurrence*: Nankauri Harbour, Octavia Bay, Cape Comorin 556 fms.; Maldive Archipelago

*Distribution*: Australia, China, Bay of Bengal, Amirante Islands

### 74. *Chloeia rosea* Potts (Fig 46, h)

*Chloeia rosea*, Potts, 1909, p 357, pl XLV, fig 3

Body fusiform in shape, of a uniform reddish pink, even the setae being of the same colour. The branchiae are exceptionally well-developed and overlap the middle line. "It is very noticeable how closely this species adheres to the *C fusca* type. The only differences from the original species are but trifling, viz, coloration, structure and arrangement of gills and the absence of a single type of seta" (Potts). It is probably a young form, or a colour variety of *C. fusca*

*Length* 11 mm by 3 mm, 20 segments

*Occurrence.* Persian Gulf.

*Distribution.* Burma, Bay of Bengal, Arabian Sea, Persian Gulf; Amirante Islands.

### Genus NOTOPYGOS Grube

Body oval Caruncle composed of a plaited crest arising from a horizontal plate, folded along its margin Branchiae ramified, *not pinnate* An accessory dorsal cirrus at the proximal side of each branchia All bristles bifurcated, smooth or denticulated Two anal club-shaped cirri Anus dorsal, subterminal

#### Key to the species of *Notopygos*

- 1 A triangular brownish area on the back *labiatus* McIntosh, p 99
- 2 Caruncle rounded posteriorly, with 30 marginal folds on each side *gigas* Horst, p 98
- Crest of the caruncle separated from the wings by a smooth, linear, pigmented area on each side, obscured under the lax folds of the wing *hispidus* Potts, p 100
- Smooth pigmented lateral area of the caruncle always to be seen *variabilis* Potts, p 100
- 75 *Notopygos gigas* Horst (Fig 47, a-c) Augener, 1926, p 439

Body large oblong oval, 33-36 segments Pale buff, in the middle of the dorsum brown or violet, irregularly interrupted by a great number of white lines crossing each other in various directions, a dark band occurs around the base of each notopodium, and the main stem of the branchiae is also dusky coloured Caruncle extending to the anterior part of the 6th segment, rounded posteriorly and with 30 marginal folds on each side Anus on the anterior of 25th segment, usually at the apex of a conical papilla Bristles long and vitreous, both dorsal and ventral bifurcate, smooth, with a yellow tip on the first three segments only, denticulated Setae with rather divergent fork

Length 45-75 mm

*Occurrence.* Ceylon, Galle, Trincomali

*Distribution:* Malaya Archipelago; India

76. *Notopygos labiatus* McIntosh

*Notopygos labiatus*, McIntosh, 1885, p 19, pl II, fig 6, pl IV, fig 2, pl IIa, figs 5, 6 Fauvel, 1932, p 57

Body large On the dorsum a triangular brownish area indicates the junction of each segment Caruncle extending to the 5th body segment Four large eyes

Fig 47—*Notopygos gigas* Hoist a, dorsal bristle  $\times 230$ , b, ventral bristle  $\times 80$ , c, dorsal bristle of first segment  $\times 230$  (after Hoist) *N. hispidus* Potts d, two middle segments, e, head and caruncle, f, dorsal seta from 6th segment (unidentate)  $\times 250$ , g, dorsal seta from 3rd segment (triserrate)  $\times 250$  *N. variabilis* Potts h, head and caruncle (after Potts)

Bristles very long, stiff and erect On the first setigerous segments only, dorsal and ventral setae serrated, next, ventral setae with 2–3 serrations Dorsal setae smooth. Anus dorsal, on the 20th–21st segment

*Length.* 20–40 mm. by 5–10 mm., setae included. The long straight, stiff, alabaster bristles give it a spinous caterpillar appearance.

*Occurrence* Andaman Islands and Laccadive Sea

*Distribution.* Pacific Ocean, Hawaiian Islands, Philippine Islands, Indian Ocean, Andaman Islands and Laccadive Sea

77. *Notopygos hispidus* Potts. (Fig. 47, d–g)

*Notopygos hispidus*, Potts, 1909, p. 359, pl. XLV, figs. 6, 7, pl. XLVI, figs. 3–5. Fauvel, 1917, p. 192; 1919, p. 350, 1922, p. 493, 1932, p. 58

?*Notopygos labiatus*, Benham, 1915, p. 205

Body elongate. On the dorsum an irregular chequered purple pattern. Caruncle extending to the 5th setigerous segment. The crest is separated from the wings by a smooth linear pigmented area on each side. The lax folds of the wings and crest often come into contact and obscure the area; this is characteristic of the species. Four black, large eyes, sometimes almost contiguous. Dorsal setae not serrated; ventral setae serrated in the first few segments alone. Anus dorsal on the 21st segment.

*Length:* 24 mm. by 10 mm., setae included.

*Occurrence:* Nankauri Harbour, Nicobar Islands, amongst coral.

*Distribution.* Australia; Philippine Islands; Indian Ocean, Red Sea.

78. *Notopygos variabilis* Potts. (Fig. 47, h).

*Notopygos variabilis*, Potts, 1909, p. 360, pl. XLV, fig. 9. Fauvel, 1931, p. 9, 1932, p. 58

Body fusiform. Dorsum sometimes ornamented with a pattern of orange spots, most specimens almost without pigment. The folded regions of the caruncle are separated on each side by a smooth pigmented area which is always to be seen. Four large eyes. Dorsal setae non-serrated, ventral setae serrated in the first few segments only, or, sometimes, a few in the ventral bundles of the middle segments with a couple of well marked serrations underneath the hooked apex of the longer limb. Anus dorsal, position varying from the 22nd to the 25th segment. Extensive variations.

*Length.* 30 mm. by 12 mm., setae included.

*Occurrence:* Andaman Islands

*Distribution:* Nankauri Harbour, Nicobar Islands, Andaman Islands, Maldive Archipelago.

### Genus EUPHROSYNE Savigny.

Body short, with few segments. Prostomium elongated and bending over the tip of the snout, partly ventral. Two pairs of eyes, one dorsal, the other ventral. Cirruncle with three longitudinal, parallel lobes. A median tentacle and two small lateral ones. Two dorsal cirri on each side. A transverse row of several branchial tufts on each segment. Two anal cirri. Bifurcate setae.

Tips of branchial divisions tapering . . . *myrtosa* Savigny, p. 101

Tips of branchial divisions expanded . . . *foliosa* Milne-Edwards, p. 102

#### 79. *Euphrosyne myrtosa* Savigny. (Fig. 48, *k-n*)

*Euphrosyne myrtosa*, Savigny, 1820, p. 64, pl. II, fig. 2. Gravier, 1901, p. 254, pl. X, figs. 147-149. Augener, 1916, p. 95. Fauvel, 1923a, p. 139, fig. 49, *k-n*, 1930a, p. 11, fig. 1; 1932, p. 59.

*Euphrosyne ceylonica*, Michaelsen, 1892, p. 2, pl. I, figs. 1-4.

Body oval, 36-43 segments. Median tentacles blunt, with a broad base. Lateral tentacles very small. 6-8 branchial tufts in each transverse row, with terminal divisions blunt or tapering, *not enlarged*. Transverse rows of dorsal furcate setae of two kinds. (1) with unequal smooth limbs, and (2) serrated "ringent" bristles. Ventral setae with straight, smooth unequal limbs.

*Length.* 10-20 mm. by 5 mm.

*Colour.* In life bright pink or red.

*Occurrence.* Ceylon, Pamban, Krusadai Island, Sandy Point, among rocks.

*Distribution.* Pacific Ocean, Malay Archipelago, Indian Ocean, Red Sea; South Atlantic Ocean, Adriatic Sea.

80. *Euphrosyne foliosa* Audouin and Milne-Edwards  
(Fig 48, a-h)

*Euphrosyne foliosa*, Fauvel, 1919, p. 350, fig. 1, 1923a, p. 136, fig. 49, a-g, 1932, p. 59  
*Euphrosyne laureata*, Horst, 1912, p. 11, pl. VI, fig. 10 Pruvot, 1930, p. 25, fig. 2

Body oval, 30-36 segments. Median tentacle thick, cylindrical. Lateral tentacles very slender and shorter. 7-9 branchial tufts in each transverse row, with terminal divisions more or less expanded and hastate. Transverse

Fig 48—*Euphrosyne foliosa* Audouin & M-Edwards a, dorsal view, enlarged, b, head, c, anterior part, ventral side, d, foot, e, f, tips of the gills, g, ringent bristle  $\times 233$ , h, ventral bristle  $\times 117$  & *E. myrtosa* Savigny k, falcigerous bristle, l, furcate bristle, m, ringent bristle, n, gills' tips (after Gravier), o, *E. intermedia* Saint-Joseph epito-

rows of furcate dorsal setae of two kinds (1) with unequal smooth limbs, and (2) serrated "ringent" bristles. Ventral setae with smooth, unequal limbs.

Length 10-30 mm by 10 mm

Colour In life orange red, cinnabar or red-brick

Occurrence. Nicobar Islands, Nankauri Harbour, Camorta Island, coral reef, Ceylon, Pamban

*Distribution* Malay Archipelago, Indian Ocean, Bay of Bengal, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea.

### Family HESIONIDAE Grube

Head with two pairs of eyes, two or three tentacles, and generally two biarticulate palps. Proboscis cylindrical, protrusible, armed or unarmed. Anterior segments (1-4) distinct, or more or less fused, each carrying two pairs of tentacular cirri. Other segments bearing uni- or bi-ramous parapodia, the dorsal ramus being often reduced to dorsal cirrus and acicula. Dorsal bristles, when present, simple. Ventral setae generally compound.

### Genus HESIONE Savigny

Body short, cylindrical. Prostomium bilobed. Four eyes. Two very small tentacles. Palps absent. Proboscis unarmed. Eight pairs of tentacular cirri (4 pairs on each side). Parapodia uniramous. Dorsal cirri long, articulate. Setae compound, sickle shaped.

#### *Key to the species of Hesione.*

*Hesione ceylonica* Grube, Willey, 1905, p 266

*Hesione eugeniae*, Kinberg, 1857, p 57, pl XXIII, fig 8

Body very slightly tapering posteriorly. Segments few (about 16 setigerous), distinct only on the sides. Proboscis smooth, with a larger circular opening and a dorsal conical fleshy papilla near the base. Dorsal cirri long,

Fig 49—*Hesione pantherina* Risso a, natural size, b, head and proboscis  $\times 8$ , c, d, two feet from one specimen, enlarged, e, f, compound setae with short and long end-piece  $\times 311$ , g, tip of a bristle  $\times 350$ .

with many short articles, borne on a large cirriophore. Ventral ramus large, cylindrical, hollow, with black spines and ending in two small retractile conical lobes. Ventral setae heterogomph, with a long sickle-shaped terminal piece, bidentate at the apex, with a sub-apical spine very variable in length.

*Length.* 30–60 mm by 5–8 mm.

*Colour.* Very variable, generally spotted or chequered, with brown rounded or elongate dots, often obsolete, or wanting in spirit.

*Occurrence* Banka Strait, Nankauri Harbour, Nicobar Islands, Andaman Islands, Chilka Lake, Orissa Coast, Krusadai Island, Rameswaram Island, Ceylon, Arabian Sea

*Distribution* Pacific, Indian and Atlantic Oceans

## 82. *Hesione genetta* Grube

*Hesione genetta*, Grube, 1878, p 102 Willey, 1905, p 267  
Fauvel, 1919, p 370, 1923, p 15, 1943, p 9

On each dorsal segment a transverse row of about 6—7 broad brown spots, the median one larger than the others Very possibly this is a mere colour variety of *H. pantherina* (Risso).

*Occurrence* Ceylon, Chilwa Paar

*Distribution* Pacific Ocean, California, Samoa, Gambier Islands, Philippine Islands; Indian Ocean, Ceylon, Madagascar.

## 83. *Hesione intertexta* Grube.

*Hesione intertexta*, Grube, 1878, p 102, pl VI, fig 5 Monroe, 1926, p 311, 1937, p 270 Pruvot, 1930, p 29

Body pale yellow, dorsum with numerous, segmentally broken, narrow longitudinal stripes and a pair of brown spots on each intersegmental line

Very likely a mere colour variety of the widespread *H. pantherina* (Risso).

*Length.* 40 mm by 5 mm

*Occurrence* Gulf of Mannar, South Arabian Sea

*Distribution* New Caledonia, Philippine Islands, Australia, Indian Ocean

## Genus LEOCRATES Kinberg.

Body short, cylindrical, segments few Prostomium bilobed Four eyes Three tentacles Two biarticulate palps Proboscis with a chitinous jaw in the mid-dorsal and mid-ventral lines Eight pairs of tentacular cirri Parapodia biramous Dorsal ramus small Dorsal setae simple Ventral setae compound Dorsal cirri long, articulate

### *Key to the species of Leocrates*

? *Leocrates iris*, Grube, 1878, p 105

*Leocrates*, spec Gravelly, 1927, p 7, pl IX, fig 5

Median tentacle short, subulate Lateral tentacles slender, slightly longer than the palps. Facial tubercle

Fig 50.—*Leocrates diplognathus* Monro a, head, dorsal view  $\times 18$ , b, chaetal blade  $\times 350$  (after Monro) *L. claparedii* (Costa) c, prostomium, enlarged, d, foot  $\times 15$ , e, lower bristle  $\times 250$ , f, part of dorsal simple bristle  $\times 350$ , g, jaws

large, blunt, more or less acorn-like Upper jaw-plate single, hooked Dorsal setae capillary, spinous. Ventral setae with a bidentate sickle-shaped terminal piece

**Length:** 20—45 mm. by 4 mm

**Colour.** Flesh-coloured in life, discoloured in spirit.

**Occurrence:** Singapore, Andaman Islands, Nankauri Harbour, Bay of Bengal, Ceylon, Gulf of Mannar.

*Distribution:* Japan, Indo-China, Indian Ocean, Persian Gulf, Red Sea, Mediterranean Sea

85. *Leocrates diplognathus* Monro (Fig 50, *a—b*).

*Leocrates diplognathus*, Monro, 1926, p 313 Fauvel, 1932, p 62, 1939, p 285

Paired tentacles about twice as long as the palps, which are furnished with very stout basal articles. Facial tubercle more or less conical and not very prominent. The anterior and larger pair of eyes, which are not clearly marked out, arise on a level with the unpaired tentacle. Behind the posterior median furrow the prostomium curves back in a remarkable wing-like pair of folds (everted nuchal organs). The upper jaw-plate is composed of two pieces set together in the form of a bifid fan. Dorsal setae with well marked spines. In the ventral setae the teeth of the blade are large and widely separated. The lamelliform guard approaches the sub-apical tooth.

*Length:* 20–30 mm.

*Colour.* Dorsum a dark chestnut-brown traversed by intersegmental bands of white.

*Occurrence.* Mergui Archipelago, 65 fms

*Distribution.* Macclesfield Bank, China Sea, Annam, Mergui Archipelago.

### Genus LEOCRATIDES Ehlers.

Differs from *Leocrates* in the absence of setae in the dorsal ramus, which is reduced to an aciculum at the base of the dorsal cirrus.

86. *Leocratides ehlersi* (Horst) (Fig. 51, *a—c*).

*Leocratides ehlersi*, Horst, 1924, p 194, pl XXXVI, figs 10–12  
Fauvel, 1932, p 62

Prostomium heart-shaped. Two pairs of eyes, the anterior larger. Median tentacle tapering. The frontal tubercle bears, on each side between the base of the palps and tentacular cirri, a cushion-shaped appendage. The dorsal jaw is double, each half consists of a long shaft with an expanded anterior plate. Ventral jaw simple, conical.

Parapodia uniramous, only a couple of minute acicula in the base of the dorsal cirrus. Terminal blade of the ventral setae short, hook-shaped, slender, with only a single tooth and lacking the secondary process beneath the bifid tip. Differs from *L. filamentosus* Ehlers only in having a double dorsal jaw.

*Length:* 25 mm

**Colour** A brownish violet subneural band.

**Occurrence.** Andaman Sea.

**Distribution.** Salhe Bay, Sumbawa, Andaman Sea

### Genus PODARKE Ehlers

Prostomium quadrangular, with three tentacles on its anterior margin Two biarticulate palps Four eyes. Proboscis unarmed, with or without filiform papillae

Fig. 51.—*Leocratides ehlersi* (Horst) a, foot  $\times 30$ , b, dorsal jaws  $\times 30$ , c, ventral jaw  $\times 30$  (after Horst) *Podarke latifrons* (Grube) d, head, enlarged, e, short ventral bristle, f, foot from mid-body

Six pairs of tentacular cirri Parapodia sub-biramous  
Dorsal cirri long Dorsal setae few, often bifurcated.  
Ventral setae compound

### Key to the species of *Podarke*

times, a furcate seta with long unequal limbs. Ventral ramus stout, with a conical lobe and a shorter rounded one Ventral cirrus subulate, short Upper ventral setae with a long, slender, terminal piece, hook-like with a sub-apical spine. Lower setae with a gradually shorter and broader terminal piece Furcate setae

**Length:** 16 mm

**Colour:** In life, brown with white rings

**Occurrence:** Camorta Island, Nicobar Islands, India, Pamban Island.

**Distribution** Philippine Islands; Indo-China; India; Indian Ocean, Persian Gulf, Red Sea; Australia (?), New Zealand (?) .

88. *Podarke latifrons* (Grube). (Fig. 51, d-f).*Podarke latifrons*, Fauvel, 1939, p. 288*Irma latifrons*, Grube, 1878, p. 109, pl. VI, fig. 6, pl. XV, fig. 11.  
Monro, 1926, p. 315

Prostomium broader than long. Palps small. Median tentacle small, fusiform. Proboscis with long cilia on the anterior margin. Long dorsal cirri, smooth or faintly ringed, *borne on a big cirrophore*. A single dorsal seta, simple or furcate, often altogether absent on a number of feet. Ventral ramus stout, with a conial lobe and a shorter rounded one. Ventral cirrus short, subulate. Upper ventral setae with a longer, slender terminal piece ending in a hook with a sub-apical spine. Lower setae with a shorter and broader terminal piece. Both kinds of setae more distinct than in *P. angustifrons*. Furcate setae scarce.

*Length:* 77 mm. by 4 mm.*Occurrence:* Singapore.*Distribution:* Philippine Islands, Hongkong, Annam; China Sea; Singapore; Australia.Genus *ANCISTROSYLLIS* McIntosh

Body elongated. Prostomium small. Eyes small or absent. Three tentacles. Large ovoid palps with very small palpostyles. Proboscis unarmed. Two pairs of tentacular cirri. Dorsal ramus reduced to a cirrus, a slender enclosed aciculum and stout spine straight or curved. Ventral ramus short, with a bundle of simple capillary setae and, sometimes, a few furcate setae. A long ventral cirrus.

*Key to the species of Ancistrosyllis*

Body rounded, stiff. Head very small, retracted into the first segments. Dorsal spines straight.

*rigida* Fauvel, p. 110

Body flat, soft. A distinct neck about the fourth segment. Head larger. Dorsal spines curved.

*constricta* Southern, p. 11189. *Ancistrosyllis rigida* Fauvel (Fig. 53).*Ancistrosyllis rigida*, Fauvel, 1919, p. 373, fig. 4, 1923b, p. 16, fig. 3, 1932, p. 64, 1939, p. 288. Augener, 1927c, p. 134, 1927, p. 50.*Kynephorus inermis*, Ehlers, 1920, p. 27, pl. III, figs. 1-9.

Body stiff, rounded dorsally. Head very small, retracted into the first segments. Palps ovoid, with a very short palpostyle and a small papilla. Median tentacle inserted between the palps, lateral tentacles very small, inserted on the palpophores. Four very small eyes. Parapodia borne on lateral square cushions. Dorsal and

Fig 53—*Ancistrosyllis rigida* Fauvel. *a*, anterior part  $\times 15$ , *b*, foot  $\times 100$ , *c*, tentacular cirri  $\times 100$ , *d*, forked bristle  $\times 700$ , *e*, capillary bristle  $\times 400$ .

ventral cirri fusiform. Dorsal ramus reduced to 1–3 slender enclosed acicula and a large blunt, faintly curved or straight spine from the 15th–20th setigerous segment backwards. Ventral setae capillary, winged, and 1–2 furcate setae. Two anal cirri. General appearance wiry.

*Length* 10–35 mm. by 0.5–1.5 mm.

*Colour.* In spirit, yellowish brown with lateral pads whitish or reddish.

*Occurrence* Andaman Islands, Madras and Orissa coasts.

*Distribution.* Gambier Islands, Indo-China, Malayan Sea, Indian Ocean, Red Sea; Atlantic Ocean, Curaça.

#### 90. *Ancistrosyllis constricta* Southern (Fig 54).

*Ancistrosyllis constricta*, Southern, 1921, p. 573, pl. XIX, fig. 1.  
Fauvel, 1930, p. 64.

Greatest width at the anterior end, a distinct neck at the 4th setigerous segment, after which the body becomes flat. Peristomium and three anterior segments longer than the succeeding ones. Flattened palps with a small palpostyle. Median tentacle twice as long as the laterals, which project a little beyond the palps. Dorsal cirri on the first setigerous segment very long and tapering. An

Fig 54—*Ancistrasyllis constricta* Southern a, anterior end, dorsal view  $\times 31$ , b, 40th right foot  $\times 78$ , c, part of dorsal lobe of 80th right foot, posterior view  $\times 257$ , d, anterior dorsal seta from 1st foot  $\times 436$  (after Southern)

enclosed dorsal slender aciculum and, between the 30th and 40th feet, a stout sickle-shaped seta. Minute papillae on the base of the dorsal cirrus. Ventral setae capillary, smooth or faintly serrated and, in the anterior feet, shorter and coarsely serrated setae.

*Length* 19 mm 155 segments

*Occurrence* Chilka Lake, Vizagapatam On muddy or sandy bottom

*Incertae Sedis*

#### Genus TALEHSAPIA Fauvel.

The characters of the genus are those of the only species known

91 *Talehsapia annandalei* Fauvel. (Fig 55, a-h)

*Talehsapia annandalei*, Fauvel, 1932, p 251, pl IX, figs 13-20,  
non Fauvel, 1935, p 333, fig 6

Body filiform, cylindrical, teguments smooth and shining First five segments slightly swollen The prostomium is a blunt cone, destitute of eyes, tentacles and processes of any kind Mouth broad Proboscis soft, cylindrical, transparent, without any papillae Pharynx extending to the middle of the 5th setigerous segment, ventricle with a pair of horny jaws, shaped, on each side, as a brown, sharp hook with an accessory paragnath The

Fig 55—*Talehsapia annandalei* Fauvel a, anterior end, compressed, showing the jaws  $\times 6$ , b, segments of posterior end  $\times 6$ , c, dorsal ramus and stout acicular bristle  $\times 54$ , d, jaws, dorsal view  $\times 43$ , e, foot  $\times 59$ , f, g, hispid setae  $\times 270$ , h, anterior end, proboscis partly extruded, pharynx and jaws seen through the body walls of the cleared specimen  $\times 6$

first five segments are slightly swollen The feet consist of a blunt cylindrical setigerous lobe with a very small ventral cirrus There is no dorsal cirrus A stout aciculum, often reddish at the tip, does not protrude outwards The setae are all simple, straight or slightly curved, and minutely hispid In front view they look faintly bipectinate. Above the setigerous lobe a stout acicular bristle arises from a broad blunt cone, sometimes accompanied with a very slender, filiform capillary seta Two short anal cirri (?)

*Length* 30–32 mm by 1 mm 54–80 segments, the last ones moniliform

*Colour* In spirit, yellowish-white, with broad, rounded, purple spots on the sides, encircling the feet

*Occurrence* Taleh-Sap, Gulf of Siam (blackish water?) Only two specimens known

*Remarks* At first, I wondered whether this species were not an aberrant Eunicid, later, a comparison with *Loandalia* Monio and *Ancistrostylis* McIntosh suggested its attribution to the *Hesionidae* as more likely The fragments of a worm from Annam which I attributed to *Talehsapia* (1935, p 333) belong to a *Loandalia* spec and not to the species from Taleh-Sap

### Family PHYLLODOCIDAE Grube

Body generally long and slender, segments very numerous Prostomium conical, oval or heart-shaped Two eyes Four or five tentacles Proboscis unarmed Segments 1–3 modified, bearing tentacular cirri. Feet uniramous (Exceptionally biramous) Dorsal and ventral cirri foliaceous Setae compound.

92. *Phyllodoce castanea* (Marenzeller) (Fig 56, a-c)  
*Phyllodoce castanea*, Fauvel, 1919, p. 359, 1932, p. 68  
*Carobia castanea*, Marenzeller, 1879, p. 127, pl. III, fig. 2 Willey,  
 1905, p. 262 Izuka, 1912, p. 199, pl. XVI, fig. 3  
*Genetyllis castanea*, Bergstrom, 1914, p. 158, fig. 53

Prostomium oval or rounded Tentacular cirri more  
 or less flattened Dorsal cirri very large, cordate, those  
 on anterior feet broader, more rounded than the poste-  
 rior ones Ventral cirri reniform

Length 10-20 mm.

Colour: Deep red, rusty or chestnut-brown in spirit.

Occurrence: Tutuorin pearl bank, Ceylon.

Distribution: California; Japan; Australia, New Zea-  
 land, Ceylon; Persian Gulf; Red Sea.

93 *Phyllodoce quadraticeps* Grube (Fig 56, f-j).

*Phyllodoce quadraticeps*, Grube, 1878, p 98, pl VI, fig 2 Gravier, 1900, p 198, pl X, figs 22-24 Fauvel, 1930, p 511, 1932, p 68

*Sphaerodoce quadraticeps*, Bergstrom, 1914, p 50

Body long, slender Prostomium nearly square, with a small posterior notch and a very minute occipital papilla Short knob-like tentacles Tentacular cirri of the three anterior pairs short, swollen, ovoid, those of the fourth pair subulate Dorsal cirri thick, rounded, rather small

Fig 56—*Phyllodoce castanea* (Marenzeller) a, anterior end (after Izuka), b, anterior foot  $\times 40$ , c, hind foot  $\times 31$  *Ph (?) zeylanica* Willey d, head, e, dorsal cirrus (after Willey) *Ph quadraticeps* Grube f, anterior end, g, hind foot *Ph malmgreni* Gravier h, foot (after Gravier)

**Length** 200 mm by 2-3 mm

**Colour** Back dirty yellow, on each segment a broad dark-coloured transverse streak Thick dorsal cirri pale yellow

**Occurrence** Camorta Island, shore collecting, Sumatra

**Distribution** Pacific Ocean, Korea Sund, New Caledonia, Philippine Islands, Indian Ocean, Bay of Bengal, Red Sea

94 *Phyllodoce malmgreni* Gravier. (Fig. 56, h).

*Phyllodoce malmgreni*, Gravier, 1900, p 207, pl. X, figs 29–31.  
*Phyllodoce malmgreni*, Fauvel, 1919, p 360, 1932, p. 68.

Prostomium heart-shaped Tentacular cirri long, subulate Papillae of the base of the proboscis more or less conical, scattered in numerous irregular longitudinal rows Dorsal cirri sub-rectangular or sub-rhomboidal Body slender

*Length:* 40–70 mm

*Colour* Back yellowish, with a dark spot on each segment, "green in life with a double row of black spots"

*Occurrence.* Vizagapatam

*Distribution:* India; Red Sea.

95 *Phyllodoce gracilis* Kinberg. (Fig. 57)

*Phyllodoce gracilis*, Kinberg, 1857–1910, p 55, pl. XXII, fig 2  
 Fauvel, 1932, p 69, fig. 12.

Fig 57—*Phyllodoce gracilis* Kinberg a, bristle  $\times 520$ ; b, c, feet  $\times 65$ , d, e, dorsal cirri  $\times 65$ , f, g, ventral cirri  $\times 65$  (from Fauvel 1932)

Long, slender body. Prostomium heart-shaped. Two large eyes Tentacular cirri long, subulate Base of the proboscis covered with numerous scattered small papillae. Dorsal cirri small, oval Ventral cirri similar, smaller.

*Length* 25–30 mm. by 1 mm.

*Colour.* In spirit, greyish-white, dorsal and ventral cirri thickly dotted with rusty brown spots.

*Occurrence.* Andaman Islands.

*Distribution:* Australia (?), Society Islands; Andaman Islands

96 *Phyllodoce fristedti* Bergstrom (Fig 58, a—b)

*Phyllodoce fristedti*, Bergstrom, 1914, p 152, fig 49, pl III, fig 1,  
Augener, 1926, p 445

? *Phyllodoce macrolepidota*, Schmarda, 1861, p 83, pl XXIX,  
fig 229 (non Willey 1905)

Body very long and slender Prostomium heart-shaped, with an occipital papilla Numerous irregular rows of small papillae on the base of the proboscis Tentacular cirri subulate, the longer ones reaching to the 6th—7th segment Average dorsal cirri oval-lanceolate, nearly twice as long as broad. Ventral cirri broad and blunt

Fig 58—*Phyllodoce fristedti* Bergstrom a, head and proboscis  $\times 4$ ,  
b, foot (after Bergstrom) *Ph (Anatides) dissotyla* Willey c,  
head, d, foot (after Willey)

**Length** 200 mm by 3 mm

**Colour** In life, body blue, cirri yellow In spirit,  
light brown.

**Occurrence** Ceylon, Trincomali

**Distribution.** Indian Ocean

**Remarks** This species is closely allied to *Ph laminosa*, differing chiefly by its more narrow and longer dorsal cirri

*Incertae Sedis*

97. *Phyllodoce* (?) *zeylanica* (Willey). (Fig 56, *d-e*).

*Anaitis zeylanica*, Willey, 1905, p 262, pl III, figs 57-60

Body slender, "head rounded, eyes large, tentacular cirri normal, elongate Proboscis (dissected) consists of two well-separated portions, a thin walled proximal or adoral portion densely covered with papillae, not serially disposed; a thick walled distal portion with six prominent rows of large sub-triangular papillae, six or seven in a row. Dorsal phyllodes broadly ovate (cordate-lanceolate) as they are in a dozen other species" (Willey) Shafts of the setae terminating in a triangular apex, fringed at the sides and articulating on one side with a long, flagelliform, strongly serrated appendix Anal cirri acuminate.

*Length:* 38 mm by 2 mm.

*Occurrence* South Mannar Island, 8-9 fms

*Remarks* Very likely a *Phyllodoce* or a *Genetyllis*, more or less akin to *Ph. castanea* (?), but not an *Anaitis*

Subgenus ANAITIDES Czerniavsky

Prostomium heart-shaped Papillae on the base of the proboscis arranged in 6 longitudinal rows on each side

98 *Phyllodoce* (*Anaitides*) *dissotyla* (Willey) (Fig 58, *c-d*)

*Phyllodoce* (*Anaitides*) *dissotyla*, Willey, 1905, p 263, pl III, figs 63-66 Fauvel, 1911, p 373

Body long and slender. Prostomium longer than broad, heart-shaped, with a very minute occipital papilla Two large eyes each with a lens The antennae do not reach back to the eyes Four pairs of long tentacular cirri. Proboscis with the adoral portion beset with longitudinal rows of rounded normal papillae, in two of the rows, median dorsal and median ventral, three large triangular papillae placed one behind the other, with normal papillae in front and behind in the same rows two sets of three on opposite sides of the proboscis Dorsal cirri rounded, not lanceolate, and strongly pedunculate. The setae are conspicuously heterogomph; their appendices with serrulated edge

*Length* 18-25 mm by 1 mm.

*Occurrence* Gulf of Mannar, 11 fms

*Distribution* India, Persian Gulf

99. *Phyllodoce (Anaitides) madeirensis* Langerhans.  
(Fig 59, d-h).

*Phyllodoce madeirensis*, Langerhans, 1879, p 307, pl XVII, fig 44 Fauvel, 1914, p 111, pl VI, figs 5-13, 1932, p 70

*Phyllodoce sancti-vincentis*, McIntosh, 1885, p 166

*Phyllodoce sancti-josephi*, Gravier, 1900, p 196, pl X, figs 20-21.

? *Phyllodoce foliosopapillata*, Willey, 1905, p 264, pl III, figs 67-69

Body slender, with a long tapering tail. Prostomium heart-shaped, with an occipital papilla. Proboscis with

Fig 59—*Phyllodoce (Anaitides) madeirensis* Langerhans d, anterior end and proboscis  $\times 7$  (after Rioja), e, anterior foot, f, foot from mid-body, g, dorsal cirrus, enlarged, h, bristle

12 longitudinal rows (6 on each side) of papillae at the base and, sometimes, a dorsal median row of 4-6 papillae. Dorsal cirri oval, lanceolate or sub-rhomboidal, very variable in shape, ventral cirri longer than the foot.

*Length* 200-600 mm by 1-3 mm

*Colour:* In spirit, yellowish-white or light brown.

*Occurrence* Malacca Straits, Meiguí, Andaman Islands, Ceylon, Laccadive Sea

*Distribution* Pacific Ocean, China, Annam, Philippine Islands, Australia, Malay Archipelago, Indian Ocean, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea

100. *Phyllodoce* (*Anaitides*) *tenuissima* Grube (Fig 60, d)

*Phyllodoce tenuissima*, Grube, 1878, p 95 Fauvel, 1932, p 70 Augener, 1927a, p 118

*Phyllodoce macrolepidota*, Willey (non Schmarda), 1905, p 265, pl III, figs 70-71

Body very long and slender Prostomium heart-shaped Two large eyes A very small occipital papilla Probos-

Fig 60—*Eulalia albo-picta* Marenzeller a, anterior part  $\times 20$ , b, 55th foot  $\times 56$  (after Marenzeller) *Notophyllum splendens* (Schmarda) c, head, enlarged (after Willey) *Phyllodoce tenuissima* Grube (= *Ph macrolepidota* Willey, non-Schmarda) d, foot (after Willey)

cis with 12 longitudinal rows of papillae at the base and a dorsal median row of three brown papillae Dorsal cirri broadly lanceolate or with the apex truncate, sub-quadrangular. Ventral cirri about the length of the foot.

*Length:* 200 mm by 3 mm

*Colour* In life, bright green, with red and yellow markings In spirit, yellowish with transverse dark-blue iridescent streaks

*Occurrence* Nicobar Islands, Ceylon

*Distribution* New Zealand, Australia, Philippine Islands, Nicobar Islands, Ceylon

*Remarks* Perhaps a mere colour variety of *Phyllo-doce madeirensis* Langerhans

### Genus EULALIA Oersted

Body long and slender, segments numerous Prostomium conical, oval or pyriform Two eyes *Five tentacles* Proboscis long and papillose, rarely smooth Four pairs of tentacular cirri, borne on three more or less distinct segments Parapodia uniramous Setae compound

#### *Key to the species of Eulalia*

#### 101. *Eulalia viridis* (Muller). (Fig 61, *a—h*)

*Eulalia viridis*, Fauvel, 1923, p 160, fig 57, *a—h* (Synonymy), 1930, p 12

Prostomium rounded Median tentacle longer, inserted between the eyes Very long proboscis beset with very numerous small papillae Tentacular cirri cylindrical or slightly spindle-shaped, inserted on three distinct segments. Dorsal cirri elongated, lanceolate Compound setae with rather short terminal piece Body long and slender

*Length* 50—150 mm by 2—3 mm

*Colour.* Bright green in life, dark olive or yellowish-brown in spirit Var. *aurea* Gravier, gold yellow

*Occurrence* Pamban

*Distribution* Cosmopolitan Atlantic, Indian and Pacific Oceans

102. *Eulalia albo-picta* Marenzelleri (Fig 60, a—b).

*Eulalia albo-picta*, Marenzeller, 1879, p 128, pl III, fig 3 Izuka, 1912, p 207 Fauvel, 1932, p 71

Prostomium broader than long Median tentacle arising from the middle of the dorsal surface of the prostomium, somewhat longer than the paired ones Two large round eyes First pair of tentacular cirri borne on the first segment, second and third pair borne on the

Fig 61 —*Eulalia viridis* (Muller) a, anterior part, enlarged, b, average foot  $\times 40$ , c, another dorsal cirrus  $\times 40$ , d, 2nd and 3rd tentacular cirri  $\times 40$ , e, bristle  $\times 400$  var *aurea* Gravier f, foot  $\times 40$  var *ornata* Saint-Joseph g, head and middle segment  $\times 30$ , h, dorsal cirrus  $\times 20$

second, which has a pair of rudimentary parapodia with bristles, fourth pair borne on the third segment Dorsal cirri cordate, with sharply pointed tips and broad bases, in anterior segments, they become lanceolate in the posterior part of the body Ventral cirri cordate, much smaller than the dorsal, shorter than the foot

*Length* 20 mm by 3–4 mm, setae included

*Colour:* Irregular, transversely elongated, white spots on the back

*Occurrence.* Nankauri Harbour, Nicobar Islands

*Distribution* South Japan, Nicobar Islands

Subgenus **PTEROCIRRUS** Claparède

Ventral tentacular cirrus of the second segment flattened and winged

103. *Eulalia* (*Pterocirrus*) *magalhaensis* Kinberg (Fig 62)

*Eulalia magalhaensis*, Kinberg, 1857-1910, p 55, pl XXXIII, fig 1 Fauvel, 1919, p 364, fig 3, 1932, p 71

*Steggoa brevicornis*, Augener, 1927a, p 120

Prostomium oval Two large eyes Tentacles subequal, longer than the prostomium. Three tentacular segments distinct Ventral cirrus of the second tentacular pair flattened and winged Proboscis covered with small papillae Dorsal cirri elongated, lanceolate Ventral cirri short and blunt

Length 30–80 mm by 0.5–1 mm

Colour In spirit, dark greenish-brown

Occurrence Singapore, Meigu Archipelago, Gulf of Mannar, Ceylon

Distribution South Pacific Ocean, Australia, New Zealand, Philippine Islands, Bay of Bengal, India, Persian Gulf, Red Sea

### Subgenus EUMIDA Malmgren.

Proboscis smooth

#### 104 *Eulalia* (*Eumida*) *sanguinea* Oersted (Fig 63, f–k)

*Eulalia* (*Eumida*) *sanguinea* Oersted, Fauvel, 1923, p 116, fig 59, f–k, 1930, p 12

foot  $\times 33$ , h, dorsal cirrus of male  $\times 33$ ,

k, var *communis* Gravier foot  $\times 49$   
 (after Gravier)

Body rather short and attenuated at both extremities. Prostomium heart-shaped, broader than long. Two black eyes. Tentacles short, the median longer and inserted in front of the eyes. *Proboscis smooth*. Tentacular cirri cylindrical. Dorsal cirri heart-shaped, ventral cirri lanceolate, shorter than the foot. Setae with swollen, spinous shaft and long terminal pieces.

*Length* 30–60 mm

*Colour* Very variable in life, violet, ochraceous, yellow, red-brown, or spotted

*Occurrence* Gulf of Mannar, Persian Gulf

*Distribution* New Zealand, Annam, Indian Ocean, Persian Gulf, Atlantic Ocean, Mediterranean Sea

### Genus NOTOPHYLLUM Oersted

Body thick. Prostomium conical or rounded. Two eyes. *Five tentacles*. Four pairs of tentacular cirri, borne on three distinct segments. Dorsal cirri broad and foliaceous. *Parapodia biramous*. Dorsal setae simple, ventral setae compound. Two anal cirri. Proboscis with soft, diffuse papillae. *Nuchal organs cirriform or foliaceous, hanging backwards*.

#### 105. *Notophyllum splendens* (Schmarda). (Fig 60 c).

*Notophyllum splendens*, Augener, 1913, p 140, fig 11. Fauvel, 1930, p 515

*Macrophyllum splendens*, Schmarda, 1861, p 82, pl XXIX, fig 227

*Notophyllum laciniatum*, Willey, 1905, p 263, pl III, figs 61–62

*Notophyllum imbricatum*, Moore, 1906, p 217, pl X, figs 1–3

*Phyllodoce multicirris*, Grube, 1878, p 100, pl VI, fig 4

Body short and thick. Prostomium rounded, with median tentacle between two large eyes. Behind the prostomium two pairs of occipital lappets, hanging backwards, and each divided into three cirriform processes. Tentacles and palps fusiform. Two pairs of tentacular cirri shorter than the others. Broad reniform, closely imbricating, dorsal foliaceous cirri. Dorsal ramus with one aciculum and a few simple setae. Ventral setae compound, with rather long serrulate end-piece.

*Length:* 15–50 mm by 1–4 mm

*Colour* Greenish or brownish, in spirit

*Occurrence.* Gulf of Mannar, Ceylon

*Distribution* Alaska; Japan, Australia, New Caledonia, Philippine Islands, Ceylon

## Genus ETEONE Savigny

Body linear, segments numerous. Prostomium triangular, with four small tentacles on the truncate anterior border. Generally two small eyes. Two pairs of tentacular cirri. Dorsal cirrus absent on the second setigerous segment. Proboscis smooth, or with soft papillae and small chitinous tubercles. Dorsal and ventral cirri foliaceous. Setae compound.

*Key to the species of Eteone*

Proboscis smooth, or with soft papillae (Subgenus *Eteone*) *barantollae* Fauvel, p. 127

Proboscis with lateral rows of large, soft papillae and small spinous tubercles (Subgenus *Mysta*) *ornata* Grube, p. 128

106. *Eteone barantollae* Fauvel (Fig. 64, a-d)

*Eteone barantollae*, Fauvel, 1932, p. 72, fig. 13

Body filiform, sub-cylindrical, segments very numerous. Prostomium broader than long, notched on each side. Two very small black eyes. Four small, short, knob-like tentacles. Proboscis smooth and transparent at the base, and with five longitudinal rows of large, soft, depressed,

Fig. 64—*Eteone barantollae* Fauvel. a, b, anterior foot, front and back view  $\times 112$ , c, foot from mid-body  $\times 112$ , d, posterior dorsal cirrus  $\times 112$ .

rounded or squarish papillae anteriorly. The median dorsal row is broader than the lateral ones which are parted, on the ventral side, by a smooth longitudinal stripe. Two pairs of tentacular cirri subulate, somewhat lanceolate and flattened, the ventral larger than the dorsal, reaching backwards to the 4th segment. On the 2nd segment a setigerous foot and a ventral cirrus, *but no dorsal cirrus*, average dorsal cirri small, rather thin, rounded or semi-oval, more or less symmetrical, borne on a large and short cirrophore. Feet conical, elongate. Ventral cirri conical or oval, relatively narrow and much shorter than the foot. Setae short, and shaft swollen at the joint. Anal cirri foliaceous, lanceolate.

*Length* 30–35 mm by 1.5–2 mm

*Colour* In spirit yellowish-white, cirri and feet lighter

*Occurrence.* Banks of the canal near Barantolla, Salt-Water Lakes, near Calcutta

107. *Eteone* (*Mysta*) *ornata* Grube (Fig 65 a–d)

*Eteone ornata*, Grube, 1877, p 106, 1879, p 15. Izuka, 1912, p 201. Fauvel, 1932, p 73

*Mysta maculata*, Treadwell, 1920, p 593, figs 1–4

“Body elongated, with three striking longitudinal rows of violet pigment spots upon a pale-yellowish colour, towards the middle part of the body the pigment spots become gradually smaller and blend into a single streak, while in the posterior region of the body they entirely disappear. Dorsal cirri comparatively small and borne on a distinct stalk, as in *E. armata* Claparède (1868) and *E. siphonodonta* D. Ch. Prostomium roundish, triangular, somewhat broader than long, and longer than the peristomium, two eyes, small and dot-like” (*Izuka*). Prostomium notched on each side.

*Occurrence:* Sandheads.

*Distribution* North Japan Seas, Philippine Islands, India.

Genus *PARALACYDONIA* Fauvel

Prostomium conical, four small tentacles at the tip. Peristomium achaetous and destitute of tentacular cirri. First setigerous segment uniramous. Succeeding segments biramous, dorsal and ventral divisions wide apart. Dor-

sal and ventral cirri not foliaceous Dorsal setae simple, ventral ones compound Proboscis unarmed

108 *Paralacydonia weberi* Hoist (Fig 65, e, f)

*Paralacydonia weberi*, Horst, 1922, p 221, figs 1—2 Fauvel, 1932, p 74

*Paralacydonia mortenseni*, Augener, 1924, p 311, fig 3, 1927b p 344

Body flattened, square in section Tentacles bi-annular Eyes absent The buccal segment and the first two setigerous ones bear, on their dorsal side, a transverse ridge-shaped enlargement and constitute together a kind of shield provided with two shallow grooves behind the head Parapodia resembling those of *Nephtys*. Dorsal ramus with a low, rounded, notched anterior lip, posterior

Fig 65—*Elcone ornata* Grube (= *Mysta maculata*?) a, head  $\times 17$ , b, foot from mid-body  $\times 37$ , c, 15th foot  $\times 37$ , d, compound seta  $\times 243$  (after Treadwell) *Paralacydonia weberi* Horst e, foot from mid-body (after Horst), f, anterior part

lip without lobes, a short erect dorsal cirrus and a bundle of simple setae Ventral ramus with a short rounded posterior lip, an anterior one bilobed, the upper lobe large, triangular, erect, the inferior lobe smaller, rounded, a digitiform ventral cirrus, a fascicle of heterogomph compound bristles and *no inferior simple setae* In the space between both foot-lobes the border is densely beset with long cilia.

*Length* 25–35 mm by 4 mm, feet included

*Colour* In spirit, a V-shaped streak of pigment at the base of the prostomium, in front of the two rectangular pads of the shield, with a small rounded external dot. Faint transverse streaks of pigment on several segments.

*Occurrence* Off Akyab, Burma, 250 fms

*Distribution* Samoa, East Indies, south of Flores, New Zealand, Burma

### Genus *LOPADORHYCHUS* Grube

Body short, prostomium broad. Two eyes. Four tentacles. Two pairs of large tentacular cirri, and a third, rudimentary or wanting, inserted on an achaetous segment fused with the prostomium. Setae simple on the first and succeeding segments, next, simple and compound setae. Dorsal and ventral cirri foliaceous. Feet conical with a rounded lamella. Proboscis unarmed.

#### 109. *Lopadorhynchus uncinatus* Fauvel (Fig 66)

*Lopadorhynchus uncinatus*, Fauvel, 1916a, p 57, pl I, figs 2, 3, pl IV, figs 4–14, 1923a, p 184, fig 67, 1932, p 75. Monro, 1937, p 266

Fig. 66—*Lopadorhynchus uncinatus* Fauvel. a, whole animal ×4, b, anterior part dorsal view and c, ventral view ×6, d, 3rd setigerous segment ×23, e, 19th setigerous segment ×23, f, hook from the 1st setigerous segment ×23, g, compound bristle ×78

Body divided into two clearly distinct regions, 25–32 segments. Third pair of tentacular cirri reduced to a small conical process inserted on the base of the second pair. The first two setigerous segments resemble each other, *they are much larger than the succeeding ones*, point forwards, and are armed with stout sigmoid sharp brown hooks. Both are destitute of ventral cirri, but have a collar.

*Length* 9–20 mm. by 2.5 mm

*Colour* In spirit yellowish and dotted with small star-shaped brown markings

*Occurrence* Reef on N side of Faladu Island, Horsburg Atoll, Maldive Archipelago

*Distribution* Maldive Archipelago, Atlantic Ocean, Mediterranean Sea

### Genus PELAGOBIA Greeff

Four tentacles. No palps. Two pairs of tentacular cirri on the same segment. Dorsal cirrus of the next setigerous segment reduced. Parapodia uniramous. Dorsal and ventral cirri slender, elongate. Setigerous lobe with one aciculum and compound setae with a denticulate terminal piece. Two anal cirri. Proboscis smooth with numerous small glands.

#### 110 *Pelagobia longicirrata* Greeff (Fig 63, a–d).

*Pelagobia longicirrata*, Greeff, 1879, p. 247, pl. XIV, figs 23–25; Fauvel, 1923a, p. 192, fig. a–c, 1939, p. 276. Bergstrom, 1914.

Body short, small, broad in the middle, 15–24 segments. Tentacles filiform. Proboscis cylindrical, unarmed, with longitudinal glands. Tentacular cirri subulate, equal, with a small setigerous lobe and short setae. Dorsal cirrus of the second setigerous segment wanting. Next, long dorsal cirri, ventral ones shorter, a conical lobe with an aciculum and compound setae with a very slightly denticulate or smooth shaft and terminal piece with a sharp denticulate edge and the other winged, smooth.

*Length:* 3–8 mm

*Colour* Colourless, transparent, or orange-red or dark-red, in life.

*Occurrence* India

*Distribution* Japan, Indo-China, Indian Ocean, Mediterranean Sea, Antarctic Ocean

## Family ALCIOPIDAE Ehlers

Transparent, pelagic. Prostomium small, between two very large spherical red eyes. Five short and simple tentacles. Proboscis crowned with a row of papillae and, often, two very long lateral ones. Parapodia uniaxial, dorsal and ventral cirri foliaceous. Setae simple or compound. Dark segmental glands. One or two anal cirri.

*Key to the genera.*

## Genus ASTEROPE Claparède.

Body short, cylindrical. Five short tentacles, the median reduced to a mere tubercle. Proboscis with two long lateral papillae and *horny denticles*. Three pairs of tentacular cirri. Broad foliaceous dorsal and ventral cirri. *Parapodia without cirriform processes*. Setae compound with a long slender terminal piece. Segmental glands coloured and bulging. Pelagic.

111 *Asterope candida* (Delle Chiaje). (Fig. 67, a-d)

*Asterope candida*, Fauvel, 1923, p. 202, fig. 75 (Synonymy).

Two pairs of very small lateral tentacles. Tentacular cirri of the first pair longer and united at the base by a transverse membrane. The first two setigerous segments rudimentary and, in the female, with dorsal cirri modified into globular seminal pouches. Dorsal cirri lanceolate, ventral cirri oval. A jutting acicular bristle, and long, slender, compound setae. Pelagic.

*Length* 150–250 mm by 2–3 mm

**Colour:** transparent, with red eyes, segmental glands brown or violet

**Occurrence** In plankton

**Distribution.** China Sea, Annam, Indian Ocean, Atlantic Ocean, Mediterranean Sea

Fig 67 —*Asteiopo candida* (Delle Chiaje) *a*, male, anterior part  $\times 10$  (after Claparède), *b*, female, ventral view, with four seminal pouches (after Hering), *c*, foot  $\times 25$ , *d*, bristle  $\times 400$

### Genus *ALCIOPA* Audouin and Milne-Edwards

Body cylindrical, transparent. Five tentacles, the median one reduced to a mere tubercle. Proboscis short, with two long lateral papillae, *without horny denticles*. Three pairs of tentacular cirri. First three setigerous segments rudimentary. Dorsal and ventral cirri foliaceous. Feet *without curiform processes*. Setae capillary, *simple*. Segmental glands coloured and bulging. Pelagic.

112. *Alciopa cantrainii* Delle Chiaje (Fig 68 a-c).*Alciopa cantrainii*, Fauvel, 1923, p 203, fig 76 (Synonymy)

Body abruptly attenuated forward and backward, rather plump and short 70–120 segments. Median tentacle ovoid. Lateral tentacles spindle-shaped. Large spherical eyes, obliquely directed. Proboscis short, crowned with trilobed papillae, the two lateral ones a little

Fig 68—*Alciopa cantrainii* Delle Chiaje a, male  $\times 2$  (after Greeff), b, female, anterior part, with two seminal pouches (after Heimg), c, foot from mid-body  $\times 35$

longer. First three pairs of feet reduced to dorsal and ventral fusiform cirri and acicular bristles. In the female, two globular seminal pouches on the second segment. The next dorsal cirri foliaceous, oval. Ventral cirri similar, smaller. Feet without cirriform process, with a long jutting acicular bristle and long, slender, simple capillary setae.

*Length.* 40–110 mm by 2–5 mm

*Colour:* Transparent, with red eyes, segmental glands brown.

*Occurrence.* Singapore, in plankton

*Distribution.* Pacific, Indian and Atlantic Oceans, Mediterranean Sea

Genus **VANADIS** Claparède. (*Alciopa*. pro parte).

Body long. transparent: segments very numerous. Five short tentacles. Proboscis cylindrical, with two very long lateral papillae without horny denticles. 3—4 pairs of tentacular cirri. Dorsal and ventral cirri foliaceous. *Feet with a cirriform process*. Setae all alike, *compound*, with a long, slender terminal piece. Segmental glands strongly coloured. Pelagic.

113 *Vanadis formosa* Claparède. (Fig. 70, *a—c*).

*Vanadis formosa* Fauvel 1923a p 205 fig 77. (Synonymy)  
Monro 1937, p 268

Body very long, 200 segments or more. Median tentacle cirriform; two pairs of lateral tentacles alike. Two large spherical eyes directed downwards. Proboscis long, with trilobed papillae and two lateral very long cirriform ones. Three pairs of tentacular cirri, the first longer. First pair of feet reduced to dorsal and ventral cirri. Two pairs of seminal pouches in the female. Feet from the 2nd, in male, and 3rd, in female, with a heart-shaped elongate dorsal and ventral cirrus, a long cirriform process, a jutting aciculum and long compound setae with a slender terminal piece. Pelagic.

*Length*. 200—300 mm by 5—6 mm.

*Colour*: Transparent with red eyes; brown segmental glands.

*Occurrence*: Arabian Sea, in plankton.

*Distribution*: Pacific Ocean; Indian Ocean; Arabian Sea; Atlantic Ocean; Mediterranean Sea

Genus **GREEFFIA** McIntosh.

Body short. Five tentacles. Proboscis with two long lateral papillae, without horny denticles. *Three or four pairs of tentacular cirri*. There are no rudimentary feet. Dorsal and ventral cirri foliaceous. *Feet with two cirriform processes*. Setae *compound*, with long terminal piece. Dorsal and ventral segmental glands coloured.

114. *Greeffia celox* (Greeff). (Fig. 69 *a—c*).

*Greeffia celox*, Fauvel, 1923a p. 208. fig. 78 *a—c*, 1939, p 283.

*Nauphanta celox*, Greeff 1876, p 69, pl. IV, figs 40—42.

≠ *Greeffia oahuensis* McIntosh, Monro, 1930, p. 82, fig. 25.

Body somewhat broad and short, tapering backwards. About 60 segments. Median and lateral tentacles short, alike. Proboscis short, with two cirriform papillae. Three or four pairs of short tentacular cirri. All feet well developed. Dorsal cirri foliaceous, heart-shaped, imbricated. Ventral cirri rounded. Feet with two cirriform processes. Aciculum little or not jutting. Long compound setae with short terminal piece. Dorsal transverse segmental glands and globular ventral glands under the feet. Pelagic.

Fig 69—*Greeffia celox* (Greeff) a, anterior part  $\times 16$  (after Greeff), b, foot  $\times 12$ , c, proboscis (after Apstein). *Corynocephalus albomaculatus* Levinsen d, dorsal view, e, f, anterior part, dorsal and ventral view, enlarged, g, ventral view of two segments with papillae (after Levinsen), h, anterior foot  $\times 20$ , i, foot from mid-body (after Apstein)

**Length** 20–60 mm by 6–12 mm

**Colour.** Transparent with red eyes, segmental glands very dark

**Occurrence** Cauda, Poulo Condore, in plankton

**Distribution** Pacific, Indian, Atlantic and Antarctic Oceans

**Remarks** Greeff attributes four pairs of tentacular cirri to this species. In European, as well as Indian Ocean specimens, I have always found only three pairs.

## Genus CORYNOCEPHALUS Levinsen

Body short, plump, segments few. Median tentacle ciliated. Two pairs of lateral tentacles, inserted under the anterior margin of the prostomium. Two large spherical eyes. (Proboscis unknown). 4–5 pairs of tentacular cirri. There are no rudimentary feet. Large foliaceous, imbricated dorsal cirri. Ventral cirri foliaceous. Feet without cirriform processes. Setae of two kinds: (1) short, acicular, (2) capillary, simple. Large ventral papillae (nephridial?) under the feet. Dorsal segmental glands small. Pelagic.

115 *Corynocephalus albomaculatus* Levinsen (Fig 69, d-i)

*Corynocephalus albo maculatus*, Fauvel 1923, p 208, fig 78, d-i (Synonymy), 1939, p 284

*Alciopina parasitica*, Claparde, 1868, p 253, pl XXXIII

Body short and broad, about 50 segments, anterior margin of the prostomium semi-circular. Median tentacle like a claviform crest between the eyes, ending behind in a free tapering tip. Two pairs of lateral tentacles, foliaceous, lanceolate, recurved under the prostomium. 4–5 pairs of tentacular cirri. All feet well developed. Dorsal cirri large, foliaceous, rounded or sub-rhomboidal, imbricated. Ventral cirri oval or subtriangular. Anterior feet with short acicular setae, and, from the fourth setigerous segment backwards, these are mixed up with very slender, simple, capillary setae. From about the 10th segment, large rounded ventral glands on the base of the feet. Dorsal segmental glands small. Pelagic.

*Length* 32 mm by 5 mm

*Colour*. Yellowish, with a longitudinal band of white spots on the ventral surface. *Habitat* when young in the gastro-vascular cavities of *Cydippe* and *Hyomiphora*.

*Occurrence* Cauda, Ream, Poulo Condore, Ceylon.

*Distribution* Indo-China, India, Indian Ocean; Atlantic Ocean, Mediterranean Sea.

## Genus RHYNCONERELLA Costa

Body slender, cylindrical. Five tentacles. Two large spherical eyes. Proboscis with small papillae, without long lateral papillae, without horny denticles. 4–5 pairs of tentacular cirri. There are no anterior rudimentary

feet Dorsal and ventral cirri broad, foliaceous Feet without cirriform processes Setae of two kinds (1) simple, acicular, (2) compound, with a slender terminal piece. Segmental glands little raised Pelagic

116. *Rhynchonerella fulgens* Greeff (Fig 70, *a'*—*d'*).

*Rhynchonerella fulgens*, Fauvel, 1923, p 210, fig 79, *a*—*d*, 1939, p 284 Augener, 1926, p 446, fig 3 Monroe, 1937, p 268

About 60—80 segments Median tentacle spindle-shaped, two pairs of longer, finger-like, lateral tentacles Proboscis with about twelve short, sub-equal papillae

Fig 70—*Vanadis formosa* Claparède *a*, male, proboscis extruded, enlarged, *b*, female, ventral side, with four seminal pouches, enlarged, *c*, foot  $\times 8$  *Rhynchonerella fulgens* Greeff, *a'*, male, ventral side, enlarged, *b'*, head (after Greeff), *c'*, proboscis half extruded, ventral view  $\times 25$ , *d'*, foot (after Apstein)

Five (four?) pairs of tentacular cirri The dorsal cirrus of the third segment longer and directed forwards, the ventral one very small. From the first setigerous segment all feet well developed, with lanceolate dorsal cirrus, ventral cirrus smaller, oval Anterior feet with several simple acicular setae and a few compound setae, next, long slender compound setae and a lower acicular one Male with large nephridial papillae under feet 10 to 13.

*Length.* 8–20 mm

*Colour:* Transparent with red eyes, segmental glands brownish-red

*Occurrence:* Ceylon, Arabian Sea, in plankton

*Distribution* Pacific Ocean, China Sea, New Guinea, Sandwich Islands, India, Arabian Sea, Atlantic Ocean; Mediterranean Sea

### Family TYPHLOSCOLECIDAE Uljanin

Pelagic Body cylindrical or fusiform, transparent. Prostomium pointed Nuchal organs projecting Dorsal and ventral cirri foliaceous Parapodia very small, with only an aciculum and a few small acicular bristles Anal cirri foliaceous.

### Genus TRAVISIOPSIS Levinsen.

Prostomium conical, ending in a more or less sharp tip. A large caruncle encircled by two prominent elongated pads (nuchal organs). Dorsal and ventral cirri wide apart A retort-shaped organ in the head

#### 117. *Travisopsis lobifera* Levinsen (Fig 71, a–d)

*Travisopsis lobifera*, Levinsen, 1885, p 336, pl I, figs 17–20  
Fauvel, 1916, p 73, 1923, p 229, fig 86, 1932, p 66 Southern,  
1911, p 33, pl I, fig 4

? *Plotobia simplex*, Chamberlin, 1919, p 155, pl 46, fig 1.

The tip of the prostomium is short The caruncle is an oval pad encircled by the nuchal organs, which are two elongated cushions projecting backwards, not as far as in *T lanceolata*, as figured by Southern (1911, pl I, fig. 3). The anterior ends of the nuchal pads do not meet before the caruncle On each side a large spoon-shaped foliaceous cirrus One pair of like cirri on the first two segments, next, lanceolate dorsal and ventral cirri provided with special sieve-like cells Feet with an aciculum and 2 acicular setae Anal cirri short, broad, rounded or subrectangular, rather variable Retort organ well marked

*Length* 20–25 mm

*Colour:* Yellow, in spirit whitish.

*Occurrence* Arabian Sea, 200 fms. to surface.

*Distribution* Pacific Ocean (?), Indian Ocean, Atlantic Ocean.

## Family TOMOPTERIDAE Grube

Pelagic Body translucent, divided into three parts head, trunk and tail Two diverging tentacles One anterior pair of cirri armed with a very long acicular bristle. The other feet biramous and achaetous, with foliaceous margin bearing chromophile glands, hyaline glands or rosettes Proboscis unarmed

## Genus TOMOPTERIS Eschscholtz

Prostomium transverse, ovoid Large eyes Proboscis long and stout Both divisions of the parapodia more or less conical, skirted all round by a membranous wing or pinnule

Fig 71—*Travisioopsis lobifera* Levinsen a, (after Levinsen), b, bristles, c, dorsal cirrus, d, head, enlarged (after Southern) *Tomopteris planktonis* Apstein f, 7th foot (after Malaquin and Carus) *T. helgolandica* Greeff h, young specimen  $\times 15$  (after Apstein), e, 6th foot (after M and G) *T. cavalli* Rosa a', 5th foot (after Rosa) *T. elegans* Chun b', 4th foot (after Rosa), c', 4th foot (after Malaquin).

## Subgenus TOMOPTERIS s str

Rosettes absent, hyaline glands generally present  
Tail and first cirrus nearly always absent

*Key to the species of Tomopteris (Tomopteris).*

118. *Tomopteris (Tomopteris) mortenseni* Augener

*Tomopteris mortenseni*, Augener, 1927, p 123, fig 5 Fauvel, 1932, p 65

Body with a short tail of reduced parapodia, about 19 segments preceding the tail Prostomium convex, not notched Two large eyes, far apart First pair of cirri absent Second pair with bristles longer than the body. Pinnules skirt the parapodia all round, and are more or less frilled and bear very large chromophile glands, from the 4th foot backwards, on the ventral one Hyaline glands present Sting absent (Rosettes on the dorsal trunk of the feet??) Planktonic

*Length* 25 mm

*Occurrence* Arabian Sea

*Distribution* South Australia, Arabian Sea

119 *Tomopteris (Tomopteris) cavalli* Rosa (Fig. 71, a')

*Tomopteris cavalli*, Rosa, 1908, p 304, pl XII, fig 20 Fauvel, 1923, p 222 Monro, 1937, p 269

Body oval lanceolate, tailless 15–20 pairs of feet Prostomium notched First pair of cirri absent, second pair with bristles about as long as two-thirds of the body Parapodial rami conical, slightly diverging Pinnules broad, rounded, overlapping Big cupola-like chromophile glands on the inferior part of the ventral ramus, from the 4th foot backwards Rosettes, sting and hyaline glands absent. Planktonic

*Length* 12–13 mm.

*Occurrence* North Arabian Sea, Ceylon.

*Distribution*: Indian and Atlantic Oceans.

120. *Tomopteris* (*Tomopteris*) *elegans* Chun. (Fig 71, *b'—c'*)

*Tomopteris elegans*, Rosa, 1908, p 294, pl XII, fig 16 Fauvel, 1923a, p 223, fig 84, *b—c*

*Tomopteris hefersteini*, Apstein, 1900, p 41 (*non* Greeff)

Body oval, tailless, 14 pairs of feet Prostomum conical with a deep notch at the back First pair of cirri conspicuous, second pair with bristles as long as about two-thirds of the body. Conical lobes of the feet diverging Pinnules broad, oboval Apico-inferior bulging chromophile glands on the ventral ramus from the 4th foot backwards Hyaline glands on dorsal pinnules only on 3rd and 4th feet

*Length* 2—8 mm

*Occurrence*: Indian Ocean, India.

*Distribution*: Indian Ocean; Atlantic Ocean, Mediterranean Sea.

121. *Tomopteris* (*Tomopteris*) *planktonis* Apstein. (Fig. 71, *f*).

*Tomopteris planktonis*, Rosa, p 301 Fauvel, 1923, p 284, fig 84, *f* Monro, 1937, p 270

Body oval, lanceolate, tailless, 13—18 pairs of feet. Prostomium not notched First pair of cirri wanting Second pair as long as three-fourths of the body Bristles very slender Parapodial lobes conical, pinnules oval Voluminous cupola-like chromophile glands near the ventral insertion of the pinnule, from the 4th foot backwards. Transparent hyaline glands only on the ventral rami.

*Length* 3—11 mm.

*Occurrence*: Central Arabian Sea

*Distribution*. Arabian Sea, South-Georgia ?, Atlantic Ocean, Mediterranean Sea.

Subgenus JOHNSTONELLA Gosse

Rosettes present, hyaline glands absent (not always). Generally a well marked tail and a first cirrus

*Key to the species of Tomopteris (Johnstonella)*

*Tomopteris helgolandica*, Fauvel, 1923, p 221, fig 83, h, i

*Tomopteris catharina*, Rosa, 1908, p 283

Prostomium oval, with short tentacles First pair of cirri often wanting in aged specimens Second pair with bristles about as long as two-thirds of the body Parapodial lobes conical, with round or oval pinnules, lanceolate on the tail A yellow rosette on the ventral ramus of the first two feet Chromophile glands very small, at the inferior part of the ventral pinnule Sting absent

*Length* 12–17 mm

*Occurrence* Amboina

*Distribution* Indian Ocean, Atlantic Ocean, Mediterranean Sea

123 *Tomopteris* (*Johnstonella*) *rolasi* Greeff (Fig 72, a)

*Tomopteris rolasi*, Greeff, 1882, p 384 Rosa, 1908, p 281 Fauvel, 1935, p 297, 1939, p 281

Body tailless, 12–15 pairs of feet Long tentacles First pair of cirri sometimes absent Second pair hardly shorter than the length of the body Yellow rosettes on the trunk of first and second feet and on the ventral pinnules of all the feet. Chromophile glands large and ventral Sting absent.

*Length* 8–10 mm

*Occurrence* Annam; Gulf of Siam.

*Distribution* China Sea, Coast of Guinea, Ambonia, Atlantic Ocean

124. *Tomopteris* (*Johnstonella*) *ducii* Rosa (Fig. 72, d)

*Tomopteris ducii*, Rosa, 1908, p 273, pl XII, figs 1–2 Monro, 1937, p 269

Body with a naked tail, one fifth of the body, 19 pairs of feet Prostomium convex, not notched First cirrus

long, second pair with bristles about as long as two thirds of the body Chromophile and hyaline glands Rosettes on the trunk of the first two feet and a smaller one on both pinnules of the third segment and the following ones. A sting present

Length. 20 mm

Occurrence Bay of Bengal, Arabian Sea

Distribution Pacific Ocean, Bay of Bengal, Arabian Sea, Coast of Mexico

125 *Tomopteris (Johnstonella) aloysi-sabaudiae* Rosa

*Tomopteris aloysi-sabaudiae*, Rosa, 1908, p 274, pl XII, figs 3-6 Fauvel, 1932, p 66

Body abruptly attenuated into a tail about as long as a third of the body, ending in a naked cylinder Pros-

Fig 72—*Tomopteris (Johnstonella) rolandi* Greeff a, anterior part  $\times 16$  (after Greeff) *T. dunkeri* Rosa b, head, c, 5th foot *T. ducii* Rosa d, 6th foot (after Rosa)

tomium slightly notched, with frontal horns First pair of cirri generally wanting (a small pair on young specimens?) Second pair of cirri with bristle about as long

as two-thirds of the body. *All feet provided with a sting*. On the first two pairs of feet a large rosette on the trunk, and, further back, on the pinnules. A chromophile gland from the first foot backwards. No hyaline glands present.

*Length* 15 mm

*Occurrence* Arabian Sea

*Distribution* Arabian Sea, West coast of Mexico

*Remarks* Very close to *T. dunkeri*, differs chiefly by its naked tail.

126. *Tomopteris (Johnstonella) dunkeri* Rosa. (Fig 72, b, c).

*Tomopteris dunkeri*, Rosa, 1908, p. 276, pl. XII, figs 7-9. Fauvel, 1935, p. 297, 1939, p. 282. Monro, 1937, p. 268.

A tail with reduced feet, about as long as three-fourths of the body, *not naked at the extremity*. A notch between the prostomial lobes. Frontal horns. First pair of cirri often absent. Second pair of cirri with bristles about as long as the body. All feet provided with a sting. On the first two pairs of feet are rosettes on the trunks and, further back, in the pinnules. A chromophile gland from the 3rd foot backwards. No hyaline gland present.

*Length* 25 mm

*Occurrence* Ceylon

*Distribution* New Guinea, Indo-China, Gulf of Siam, Indian Ocean, Ceylon, Red Sea

### Family SYLLIDAE Grube

Body small, slender, elongated. Prostomium generally rounded or quadrangular. Three tentacles, two palps, four eyes. Two pairs of tentacular cirri borne on the first segment, which is achaetous. Proboscis divided into two regions (1) pharynx, with chitinous walls and one or more teeth and (2) a more or less barrel-shaped proventriculus. Feet uniramous, with a dorsal and a ventral cirrus, of which the latter may, however, be absent. Setae generally compound, with a terminal falcate, unidentate or bidentate, process. Swimming feet with simple dorsal bristles, in sexual forms.

*Syllis djiboutiensis*, Gravier, 1900, p 147, pl IX, fig 3 Fauvel, 1919, p 353

Body elongate, tapering Pharynx long, tooth terminal Proventriculus long Dorsal cirri elongated, 20-30 articles Compound setae absent. Simple, stout, hooked bristles, bidentate, with upper tooth simple or bifid

*Length* 20-50 mm

*Colour* Orange or yellowish.

*Occurrence* Ceylon, Tuticorin, amongst sponges, Maldivé Archipelago

*Distribution* Pacific, Indian and Atlantic Oceans, Mediterranean and Red Sea

128 *Syllis (Syllis) gracilis* Grube. (Fig. 73, f-i).

*Syllis gracilis*, Fauvel, 1923a, p 259, fig 96 (Synonymy), 1932, p 76 Willey, 1905, p 269 Gravelly, 1927, p 8 Augener, 1926, p 432 Monro, 1937, p 271

*Syllis longissima*, Gravier, 1900, p 159, pl IX, fig 7

Body slender. Pharynx elongated, with anterior tooth Dorsal cirri short, cylindrical or fusiform, with alternately 7-8 and 10-12 articles Anterior and posterior setae compound, in the middle region of the body, large simple, ypsiloid, crutch-like setae.

*Length:* 20–50 mm.

*Colour.* Pale yellowish brown, with sometimes streaks of small brown dots on the back of the anterior segments

*Occurrence:* Andaman Islands, Ceylon, Gulf of Mannar, Tuticorin, Maldivé Archipelago.

Fig 73—*Syllis krohnii* Ehlers a, anterior part, enlarged, b, compound bristle from mid-body  $\times 390$ ; c, anterior bristle  $\times 390$ , d, simple ventral seta  $\times 390$ , e, aciculum  $\times 390$  *S. gracilis* Grube f, anterior part, enlarged, g, foot, h, stout simple bristle  $\times 390$ , i, compound bristle  $\times 390$

*Distribution:* Indian Ocean, Persian Gulf, Arabian Sea; Pacific and Atlantic Oceans Cosmopolitan

129. *Syllis* (*Typosyllis*) *variegata* Grube (Fig 74, h–n)

*Syllis* (*Typosyllis*) *variegata*, Fauvel, 1923a, p 262, fig 7 (Synonymy), 1932, p 76 Gravely, 1927, p 8 Pruvot, 1930, p 31 Monro, 1937, p 270

*Syllis compacta*, Gravier, 1909, p 165, pl IX, fig 11

Body long and slender, Pharynx more or less elongated, with an anterior conical tooth Dorsal cirri alternately long and short, with numerous articles (20–25 and 30–45) Falcate terminal piece of all the setae more or less distinctly bidentate. On the last setigerous segments a dorsal and a ventral simple acicular seta.

*Length:* 10–35 mm

*Colour* Very variable.

*Occurrence* Ceylon, Gulf of Mannar; Arabian Sea, Persian Gulf

*Distribution.* Pacific, Indian and Atlantic Oceans, Mediterranean Sea.

130. *Syllis (Typosyllis) prolifera* Krohn. (Fig. 74, a–g)

*Syllis (Typosyllis) prolifera*, Fauvel, 1923a, p 261, fig 97, a–g (Synonymy), 1930, p 13 Pruvot, 1930, p 31

Body long and slender. Pharynx rather short, with the conical tooth on the anterior third Proventriculus

Fig 74—*Syllis (Typosyllis) prolifera* Krohn a, anterior part (after Claparède), b, head of the stolon *Chaetosyllis* (after Langerhans), c, d, upper and inferior bristles from mid-body  $\times 390$ , e, posterior bristle  $\times 310$ , f, simple ventral seta  $\times 390$ , g, simple dorsal seta  $\times 390$  *S. (Typosyllis) variegata* Grube h, anterior part  $\times 8$  (after Claparède), i, foot, k, l, median and posterior compound bristles  $\times 390$ , m, n, ventral and dorsal simple setae  $\times 390$

short Dorsal cirri alternately long and short, with numerous articles (20–25 and 30–40). Falcate setae, especially median and posterior ones, short and conspicuously

bidentate On the last setigerous segments a dorsal and a ventral, simple bidentate, acicular seta

*Length* 10–25 mm

*Colour* Very variable Anterior part more or less brown, with transverse streaks

*Occurrence* Gulf of Mannar, Ceylon, Shingle Island

*Distribution* Pacific, Indian and Atlantic Oceans, Mediterranean Sea

*Remarks* *S. variegata* and *S. prolifera* are very likely only varieties of a single species

131. *Syllis* (*Typosyllis*) *krohnii* Ehlers (Fig 73, a–e)

*Syllis* (*Typosyllis*) *krohnii*, Fauvel, 1923, p 259 a–c (Synonymy), 1930, p. 517

Body thick anteriorly, tapering behind A well marked occipital protuberance Pharynx with an anterior conical tooth Proventriculus short Anterior dorsal cirri alternately short and long, slender and broad, *more or less swollen at the tip*, with numerous articles, short, close together and spotted Falcate setae with a shaft swollen at the tip and a short unidentate terminal piece, the anterior ones with a small sub-apical tooth. On the last setigerous segments a dorsal and a ventral, slightly bidentate, acicular seta

*Length* 15–30 mm

*Colour* Transverse violet-brown streaks on anterior segments Cirri spotted with brown or opaque white dots

*Occurrence*. Gulf of Mannar, Shingle Island

*Distribution* New Caledonia: (Australia ?), Indian Ocean, Atlantic Ocean, Mediterranean Sea

132. *Syllis* (*Typosyllis*) *closterobranchia* Schmarda (Fig 77, a–c).

*Syllis closterobranchia*, Ehlers, 1904, p 19, pl III, figs 1–4 Augener, 1913, p 29, fig 23 (Synonymy) Fauvel, 1919, p 354, 1930, p. 14, 1932, p 77

(?) *Syllis brachychaeta* Schmarda, Augener, 1927a, p 145 Monro, 1937, p 271.

(?) *Syllis hyalina*, Willey, 1905, p 294

Dorsal cirri short and spindle-shaped Body slender In the anterior and posterior regions of the body the

setae are bidentate, in the median their sickle-shaped appendices are large and unidentate and they are very easily detached, the shaft then resembling the ypsiloid setae of *S. gracilis*, but in the latter it is the sickle which is fused with the shaft

*Length.* 30 mm

Uncoloured, in spirit

*Occurrence* Diamond Island, Andaman Island, Gulf of Mannar.

*Distribution* Japan, Australia, New Zealand, New Caledonia, Indian Ocean, Red Sea

133. *Syllis* (*Typosyllis*) *exilis* Gravier. (Fig. 75, a'—f)

*Syllis exilis*, Gravier, 1900, p 160, pl X, fig 19 Fauvel, 1917, p 195, pl V, fig 24, 1930, p 14, 1932, p 77 Augener, 1913, p 192

? *Syllis solida*, Grube, 1878, p 120, pl VII, fig 7

Fig 75—*Syllis* (*Haplosyllis*) *spongicola* Grube a, anterior part (after Claparède), b, c, simple bristles  $\times 272$ , d, aciculum  $\times 272$  *S* (*Typosyllis*) *exilis* Gravier a', foot  $\times 47$ , b', inferior unidentate bristle  $\times 272$ , c', another inferior bristle  $\times 428$ , d', e, f, three ventral bristles from one foot, upper, median, and lower  $\times 272$

Body stout, convex dorsally. A well marked cephalic hood. Pharynx with a large anterior tooth. Dorsal cirri long and slender, with very numerous short articles. The shafts of the lower setae of the anterior feet are noticeably

swollen and the terminal piece is a large, bent, simple, hook. The terminal pieces of the upper setae are more elongated and have an accessory process. The dorsal cirri are inserted high above the feet and alternate, as in *Eusyllis ceylonica* Augener, but the cirri are articulate and the setae different. In general appearance it looks like an *Eusyllis*.

*Length* About 20–30 mm

*Occurrence* South Point, Andaman Islands, Madias coast, Maldive Archipelago

*Distribution* Japan, Australia, New Zealand, New Caledonia, Gambier Islands, Indo-China, Arabian Sea, Gulf of Oman, Red Sea

134. *Syllis* (*Typosyllis*) *okadae* Fauvel (Fig 76)

*Syllis okadae*, Fauvel, 1934, p 307, figs 1–2, 1939, p 292

Body broad, flattened. Prostomium with four large eyes. Palps long, not fused. Median tentacle longer than the lateral ones, which are slightly longer than the palps. Pharynx with anterior tooth. Anterior dorsal cirri

Fig 76—*Syllis* (*Typosyllis*) *okadae* Fauvel a-e, sickle shaped bristles  $\times 498$ , f, dorsal cirrus  $\times 175$ , g, segments from mid-body, dorsal view  $\times 10$  h, anterior part, enlarged

thick, cylindrical, blunt, with numerous short and close articles, the following ones more slender, with 10–15 articles, about as long as half the breadth of the body. Feet short, thick, ventral cirri finger-like. Shafts of the setae swollen and curved at the tip, falciform end-pieces short, curved, unidentate. On the last segments a long simple seta, straight or slightly curved.

*Length* 19–20 mm by 1 mm

*Colour* Palps and prostomium dark, first and second segments dark-violet, next four segments white, then three dark-violet and two brownish, next, the back is brown with two longitudinal rows of clear spots. The second white collar sometimes absent.

*Occurrence* Corbyn's Cove, Andaman Islands.

*Distribution* Seto, Japan, Ream, Gulf of Siam; Andaman Islands

135 *Syllis* (*Ehlersia*) *cornuta* Rathke (Fig. 79, g–i).

*Syllis* (*Ehlersia*) *cornuta*, Fauvel, 1923a, p. 267 fig. 100, 1930, p. 14.

*Ehlersia sexoculata*, Langerhans, 1879, p. 537. Saint Joseph, 1905, p. 181.

Body slender. Anterior tentacles slender, subequal. Pharynx very long, with an anterior tooth, proventriculus long. Dorsal cirri long and slender with about 12–20 articles. Compound setae of two kinds: (1) with a very long and very slender, slightly pectinate and bidentate terminal piece, (2) falcigerous with a short, spinous, bidentate end-piece. Both kinds present in the same feet. On the last segments, a dorsal and a ventral simple seta.

*Length* 10–15 mm

Uncoloured, in spirit.

*Occurrence* Gulf of Mannar, Krusadar Island

*Distribution* Indo-China, India, Arabian Sea; Persian Gulf, Atlantic Ocean, Mediterranean Sea.

Genus *OPISTHOSYLLIS* Langerhans.

Tentacle and cirri articulated. *Tooth in the proximal part of the pharynx.* A flap-like process, or hood, on the posterior part of the head.

*Key to the species of Opisthosyllis*

*unidentate* On the last segments a simple seta and 3–4 large aciculae. Stolon with long, slender, swimming setae.

*Length* 40 mm by 1 mm

*Occurrence* Gulf of Mannar, Krusadai Island

*Distribution* Indian Ocean, Atlantic Ocean, Madeira, Tropical coast of Africa

138. *Opisthosyllis australis* Augener (Fig 80, g–i)

*Opisthosyllis australis*, Augener, 1913, p 218, pl XXVIII, fig 35  
Fauvel, 1923b, p 13, 1930, p 518

Body plump, rounded dorsally, covered with small globular papillae. A well marked nuchal flap (hood). Pharynx with a posterior tooth in the 13th segment. Prostomium oval. Two pairs of eyes. Dorsal cirri long, with 38–40 articles. Ventral cirri finger-shaped. Parapodia with small globular papillae. Falciform end-pieces of the setae rather long and bidentate in the anterior feet, they become shorter and unidentate posteriorly and are mixed with stout simple setae in the median and posterior regions.

*Length* 18–20 mm

*Occurrence.* Ceylon

*Distribution* Australia, Gambier Islands, New Caledonia, India, Ceylon

### Genus TRYPANOSYLLIS Claparède

Body flat, ribbon-like. Palps well apart. Proboscis with a circular crown of small teeth (trepan) and a single conical dorsal tooth. Tentacles and cirri long, distinctly articulated. Ventral cirri lanceolate. Bristles with rather large sickle-shaped terminal piece.

#### *Key to the species of Trypanosyllis*

139 *Trypanosyllis zebra* Grube. (Fig. 79, a-d)

*Trypanosyllis zebra*, Fauvel, 1923a, p 269, fig 101, 1930a, p 15, 1932, p 78 Pruvot, 1930, p 35 Monro, 1937, p 273

*Trypanosyllis richardi*, Gravier, 1900, p 68, pl 9, figs 12-13

Body flattened, dorsum somewhat rounded anteriorly. Segments short and numerous. Prostomium broader than long. Dorsal cirri alternately long and short, dis-

Fig 79—*Trypanosyllis zebra* Grube a, anterior part  $\times 17$ , (after Claparède), b, trepan (after Langerhans), c, foot, d, compound bristle  $\times 437$  *Syllis (Ehlersia) cornuta* Rathke g, anterior part, enlarged, h, i, compound bristles  $\times 350$  s (*Ehlersia*) *ferruginea* Langerhans, k-n, bristles

tinctly articulated. Terminal pieces of the setae bifid and spinous on the edge.

*Length* 30–60 mm.

*Colour* Anteriorly the dorsum is banded with violet-brown bars, two on each segment. Dorsal cirri white, or, often, violaceous or lilac.

*Occurrence* Mergui Archipelago, Andaman Islands, Ceylon, Krusadai Island; Gulf of Mannar, Tuticorin, Madras coast, Persian Gulf.

*Distribution* Pacific Ocean, Japan, China Sea, Annam, Indian Ocean, Atlantic Ocean, Mediterranean Sea.

140. *Trypanosyllis gigantea* (McIntosh) (Fig 80, (e-f))  
*Trypanosyllis gigantea*, Fauvel, 1914b, p 105, pl VII, figs 14-15, 1917, p 200 (Synonymy), 1919, p 355, 1932, p 78 Augener, 1924, p 371, 1927, p 151 Benham, 1927, p 56  
*Syllis gigantea*, McIntosh, 1885, p 193, pl XXX, figs 1-3, pl XXXIII, fig 4, pl XVa, fig 14, pl XXIVa, fig 7

Differs from *T. zebra* in (1) its larger size, (2) absence of, or if present only very faint, transverse pigment-ed streaks on the dorsum and (3) the treminal pieces of the bristle being simple hooks

Fig 80—*Autolytus orientalis* Willey a, anterior part  $\times 7$ , b, bristle, much enlarged (after Willey) *Parasphaerosyllis indica* (Monro), c, middle region from above, d, bristle (after Monro), *Trypanosyllis gigantea* (McIntosh), e, f, bristles *Opisthosyllis australis* Augener, g, anterior upper bristle  $\times 320$ , h, inferior bristle  $\times 320$ , i, bristle from mid-body  $\times 320$  *Eusyllis ceylonica* Augener j, k, superior and inferior bristles from 25th foot  $\times 660$  (after Augener).

*Length* 80-90 mm. by 5-7 mm

*Occurrence* Nankauri Harbour, Nicobar Islands

*Distribution:* South Pacific, Indian Ocean.

141. *Trypanosyllis misakiensis* Izuka

*Trypanosyllis misakiensis*, Izuka, 1912, p 185, pl XX, figs 2-6  
 Fauvel, 1932, p 78 Monro, 1939, p 391.

Body elongate, depressed, dorsum slightly convex. Segments short and numerous. Prostomium bilobed. All the three tentacles equal. Dorsal cirri annulated, borne on a prominent ctenophore. Bristles stout, falcate, the end-piece bifid, with a basal spur (3 teeth according to Izuka). The posterior extremity of the worm is capable of producing successive crops of collateral sexual buds showing an external structure similar to that of the mother individual.

*Length* 22 mm by 2 mm with 130 segments

*Colour* In spirit, uniformly milk-white

*Occurrence* Madras Coast

*Distribution* Japan, Madras Coast

### Subfamily EUSYLLINAE

### Genus EUSYLLIS Malmgren

Palps fused at the base. Three tentacles. Two pairs of tentacular cirri. Opening of the proboscis crowned with a row of soft papillae and a chitinous denticulated ring, and an anterior tooth. Tentacles and cirri smooth or more or less distinctly pseudo-articulate when contracted. Compound falciform setae.

#### 142 *Eusyllis ceylonica* Augener (Fig 80, h, l)

*Eusyllis ceylonica*, Augener, 1926, p 453, fig IV Fauvel, 1930, p 519

(?) *Typosyllis taprobanensis*, Willey, 1905, p 268, pl III, figs 77-78

Body short, thick, rounded dorsally. Four small eyes. A well marked occipital prominence. Pharynx with a chitinous ring, smooth or faintly denticulate, and an anterior tooth. Tentacles sub-equal. Dorsal cirri alternately long and short, more or less pseudo-articulate, the longer ones inserted on the sides much more above the feet than the shorter ones. The falciform end-pieces of the upper setae longer than those of the lower setae, both are conspicuously bidentate.

*Length* 20-30 mm by 2 mm

*Colour* Reddish-yellow, or with two brown transverse bands on each segment

*Occurrence* Ceylon

*Distribution* New Caledonia, Ceylon.

## Genus ODONTOSYLLIS Claparède

Palps fused at the base. Tentacles and cirri not distinctly articulate. A flap-like process, or hood, on the posterior part of the head. A transverse row of large teeth, pointing backwards, inserted on the anterior edge of the pharynx.

113 *Odontosyllis graveleyi* Fauvel (Figs 81, a—i 82)

*Odontosyllis graveleyi*, Fauvel, 1930 p. 16, figs 3—4

*Syllis* sp. Graveley, 1927, p. 8

Body long, thick, rounded dorsally, very brittle, 80—150 segments. Prostomium subrectangular. Four large eyes set in a trapezium. Three tentacles, the median

Fig. 81—*Odontosyllis graveleyi* Fauvel. a, anterior part  $\times 10$ , b, foot with swimming bristles  $\times 50$ , c, anterior foot  $\times 50$ , d, e, bristles with short bidentate end-piece  $\times 330$ , f, g, bristle with long end-piece  $\times 330$ , h, simple posterior seta  $\times 330$ , i, simple bidentate posterior seta  $\times 330$ . *O. rubrofasciata* (Grube) j, l, two falci-gerous setae from one posterior foot  $\times 100$ .

twice as long as the laterals. Two broad palps. Proboscis with 6—7 large pharyngeal teeth pointing backwards and two large lateral folds. Pharynx extending from the 4th—5th segments to the 10th. Proventriculus twice as long. A rounded flap over the prostomium. Two pairs of long, unequal, tentacular cirri. Dorsal cirri unjointed,

rapidly decreasing in length, about as long as half the body's breadth. Ventral cirri broad and short. Compound setae of two kinds in every foot, the upper ones with a long needle- or awl-like terminal piece, slightly flattened, very indistinctly bifid and bulbous at the tip, the lower ones much more numerous, with an enlarged shaft and a short bidentate appendix. On the last segments, a small dorsal simple seta, slightly bent, and a ventral simple bifid seta. Mature specimens with long swimming bristles. Two long anal cirri. Phosphorescent.

Fig 82—*Opisthosyllis graveleyi* Fauvel a, section of anterior part  $\times 45$ , b, armature of the proboscis  $\times 45$

*Length* 15–30 mm by 1.5–2 mm

*Colour* Yellowish white with a longitudinal dark-brown dorsal streak running the whole length of the body. On a variable number of anterior segments, a brown dorsal spot at the base of the feet. Swarming in May and September, a few days after the new moon.

*Occurrence* Gulf of Mannar, anchorage at Krusadai Island and off the end of Sandy Point.

Subfamily *EXOgoninae*Genus *PARASPHAEROSYLLIS* Monro

Dorsal cirri alternately short, bulbous and slender, moniliform. Palps fused at the base.

144. *Parasphaerosyllis indica* Monro (Fig 80, c-d)

*Parasphaerosyllis indica*, Monro, 1937, p 273, fig 8 Fauvel, 1939, p 298

Body slender and thread-like. Head broader than long, with two pairs of eyes, arranged in a trapezium. Palps fused at the base only. Pharynx with an anterior tooth. Proventriculus short. Tentacles and the first 15 dorsal cirri moniliform, with about 15 articles. Two pairs of tentacular cirri. From the 16th setigerous segment to the end of the stock large bulbous fusiform cirri, with a small terminal knob, alternate with slender moniliform cirri. The setae are slender, with a straight end-piece, faintly bidentate at the tip. The beginning of the stolon is marked by two pairs of eyes.

*Length* 8–11 mm by 0.5 mm

There is no colour.

*Occurrence.* Arabian coast

*Distribution* Arabian Sea, Cauda, Annam

*Remarks* Monro places this species among the *Exogoninae*, which appears unlikely because of its palps fused at the base only and its moniliform cirri.

Subfamily *AUTOLYTinae*Genus *AUTOLYTUS* Grube.

Ventral cirri absent. Palps little developed, attached to the ventral surface of the cephalic lobes. Cirri unarticulate, filiform, present on every segment. Proboscis sinuous, with a crown of small teeth. Proventriculus ovoid. Falcate bristles with short bifid tips. Sexual generation shows dissimilar males and females (*Polypostrichus* and *Sacconereis*).

145. *Autolytus orientalis* Willey (Fig 80, a, b)

*Autolytus orientalis*, Willey, 1905, p 270, pl IV, figs 80–84 Augener, 1926b, p 454, fig 5 Fauvel, 1932, p 80

About "30 setigerous segments in the anterior or parent individual. The parapodia contain two acicula and numerous, upwards of 20, compound falcigerous setae, the head of the shaft is lacinate and the appendix is minutely bidentate and minutely fringed. The dorsal

cirri are rather short, lanceolate, petaloid, with strong basal articulation. The second dorsal cirrus, *i.e.*, the cirrus of the first setiger, is the longest. The rounded reduced palps, joined together in the middle line along their own length, are only visible from below. The pharynx is long and has a sigmoid flexure, it is armed in front with a circle of 44 denticles, larger and smaller irregularly alternating. The proventriculus shows 28 glandular rows" (Willey.)

In both specimens from Chandipore the parent stock has about 30 setigerous segments. One bears a single stolon and the other two. Augener has figured the free swimming male stolon or *Polybostrichus*.

*Occurrence* Ceylon, Orissa, Chandipore, near Bala-sore, taken at low tide on Chaetopterid tubes.

#### *Incertae sedis*

149. *Sacconereis* spec., Fauvel, 1932, p. 80. Andaman Islands in plankton

#### Family NEREIDAE Johnston. (Fig. 83)

Body elongated, rounded or somewhat flattened. Prostomium with four eyes. Two subulate tentacles. Two massive two-joint palps. Four pairs of tentacular cirri. Proboscis armed with a pair of horny jaws and, generally, a series of horny teeth (paragnaths) which may be arranged in eight groups. Feet biamous (except in *Lycastis*) after the second foot. Dorsal and ventral cirri. Dorsal ramus with 2-3 lobes or ligules, ventral ramus with two fillets and one lobe. Setae compound, spinigerous and falcigerous. Generally an epitokous, *Heterone-reis*, mature form.

*Remarks* The chief characters used for the identification of Nereids are, first, those of the proboscis, next of the feet and, last, of the setae. The everted proboscis is armed, at its opening, with two lateral, horny, falciform jaws, more or less denticulate. The trunk is divided into two rings, an anterior distal, or maxillary ring, and an inferior, proximal, basal or oral ring. It is

divided into twelve areas on which are inserted the groups of horny denticles, or paragnaths. These areas are designated by Roman numerals as follows: *Maxillary ring*, dorsal median group I, two dorso-laterals II, ventral median III, two ventro-laterals IV, *Oral ring*, median dorsal V, two dorso-laterals VI, median ventral VII, two ventro-laterals VIII.

Fig 83—*Nereidae* a, b, head with proboscis extruded showing the numbers of the groups of paragnaths, c, first foot (uniramous), d, average foot from mid-body (biramous), e, homogomph spiniger (or aristate) bristle, f, heterogomph spiniger, g, long heterogomph falciger, h, short heterogomph falciger, i, dorsal homogomph falciger, k, swimming bristle of *Heteronereis* stage

**Parapodia** Those of the first two segments are uniramous, all the others biramous. Each ramus is supported by a strong, enclosed, aciculum and bears 2–3 more or less flattened lobes, the size and form of which may vary materially and gradually from before backwards. The last ones are sometimes highly modified and then afford important features for identification. Consequently it is always advisable to examine carefully anterior, middle and posterior feet of any specimen.

The setae more rarely afford specific distinctions. Typically, in a Nereid's foot, there is a dorsal bundle of homogomph, spinigerous setae, a ventral upper bundle of homogomph spinigerous and heterogomph falcigerous setae and a lower bundle of heterogomph spinigerous and

heterogomph falcigerous setae Moreover, in some species, there is an homogomph falcigerous seta in the dorsal ramus Large simple ventral setae or hooks are uncommon

### Genus LYCASTIS Savigny.

All feet uniramous Proboscis without paragnaths

#### *Key to the species of Lycastis*

- Dorsal setae numerous Dorsal cirri broad and flattened *meraukensis* Horst, p 166
- Dorsal setae rare or missing Dorsal cirri more elongated and rather narrow *indica* Southern, p 167
- 150 *Lycastis meraukensis* Horst (Fig. 85, b).  
*Lycastis meraukensis*, Horst, 1918, p 246 Fauvel, 1932, p 82

Head broader than long, rounded, trapezoidal, provided with a median longitudinal groove Eyes situated laterally in the posterior margin of the head, the external of each pair is the larger and is placed somewhat more anteriorly than the internal Antennae short, conical Palps with a stout basal part and a small, papilliform, distal joint Maxillae short and stout The longest tentacular cirrus reaches to the 2nd or 3rd segment Dorsal cirri enlarged and flattened, leaf-like, overlying each other (in small specimens they are slender and pointed) A fascicle of 8–10 dorsal slender setose bristles (missing in the posterior body region) Neuropodium cylindrical, with heterogomph spinigerous and falcigerous bristles, the terminal piece of which is rather short and broad and ciliated

*Length* 150–200 mm by 20–22 mm

*Occurrence* Bangkok, Siam, Mergui

*Distribution* New Guinea, Bangkok, Mergui

Fig 84—*Lycastis indica* Southern a, anterior end, dorsal view  $\times 15$ , b, foot of a specimen with dorsal bristles and narrow dorsal cirrus  $\times 70$

151. *Lycastis indica* Southern (Fig 84, a, b, 85, a).

*Lycastis indica*, Southern, 1921, p 578, pl XIX, fig 2 Horst, 1924, p 4 Fauvel, 1932, p 82, pl II, figs 1–2

Longitudinal groove of the head ending in a pit, eyes situated more or less in a line and provided with lenses Dorsal cirri rather narrow, length and breadth varying materially they are very long and recurved on the back in the posterior region Dorsal setae missing or very few, 1–2, rarely more Terminal piece of the falcate setae long and narrow, but thick Hemigomph and heterogomph spinigerous setae

*Length* 12–150 mm by 2–5 mm

*Colour* Reddish-brown pigment in the anterior part of the body, increasing in redness and density towards the tail

*Occurrence* Calcutta waterworks, Salt lakes, Calcutta, Chulka Lake, Madras, brackish waters of India,

Andaman Islands Euryhaline from fresh water to blackish and sea-water.

*Distribution* Macassar, India

### Genus TYLONEREIS Fauvel

Feet biramous. Dorsal ligule foliaceous *All setae homogomph spinigerous* Proboscis with soft papillae, without paragnaths Prostomium, tentacles, palps and tentacular cirri as in the genus *Nereis* Cuvier.

#### Key to the species of *Tylonereis*

Ventral setigerous lobe trilobed *bogoyawlenskyi* Fauvel, p 168  
 Ventral setigerous lobe bilobed *fauveli* Southern, p 169

#### 152 *Tylonereis bogoyawlenskyi* Fauvel. (Fig 85, e, f).

*Tylonereis bogoyawlenskyi*, Fauvel, 1911, p 373, pl XIX, figs 1-7, 1932, p 83 Gravely, 1927, p 11, pl X, figs 18-19

Fig 85—*Lycastis indica* Southern a, 70th foot  $\times 100$  (after Southern) *L. meraukensis* Horst b, foot, *Tylonereis fauveli* Southern c, 7th foot  $\times 50$ , d, 30th foot  $\times 50$  (after Southern) *T. bogoyawlenskyi* Fauvel e, foot from mid-body  $\times 35$ , f, 7th foot  $\times 35$

Prostomium broader than long, notched Tentacles short Proboscis with conical soft papillae, groups I=0 or 3; II=0 or 1, III=8-10, IV=a group of 4-5 on

each side, V = 0, VI = one papilla on each side, VII = 2 on each side, VIII = 0, or a row of depressed lobes. Feet biramous. Setae long homogomph spinigers, all alike. Dorsal and ventral cirri very small. Dorsal ligule triangular, foliaceous. Dorsal fillet (setigerous lobe) elongated, expanded at the tip in the anterior segments, bifid in the posterior ones. Ventral setigerous lobe at first trilobed, but bilobed in posterior feet. Ventral lower ligule decreasing in size backwards. A pair of anal cirri. Burrows in sand or mud.

*Length* About 60 mm by 4 mm, feet included.

*Colour.* In life, of a bright pink colour, with a transverse brown line on each segment at the anterior end and a dark-red mid-dorsal line.

*Occurrence* Krusadai Island, Tuticorin beach, Kalkalai, Pamban backwater, Neendakara Bar and Veli Lake, Travancore.

*Distribution* Gulf of Mannar, Travancore, Persian Gulf.

153 *Tylonereis fauveli* Southern (Fig 85, c-d)

*Tylonereis fauveli*, Southern, 1921, p 582, pl XIX, fig 3. Fauvel, 1930a, p 19, 1932, p 84.

Differs from *T. bogoyawlenskyyi* only in having the ventral setigerous lobe bilobed, instead of trilobed, in the anterior as well as in the middle and posterior feet. Size rather large.

*Occurrence* Mergui, Chilka Lake, Pamban.

### Genus LEONNATES Kinberg

Proboscis with both soft and horny paragnaths. Falcate bristles with a convex denticulated border.

#### *Key to the species of Leonnates*

End-piece of the falcigerous bristles hooked at the tip

*jousseaumei* Gravier, p 169

End-piece of the falcigerous bristles enlarged and abruptly truncate at the tip

vex border. They are present on the first setigerous segments in both the ventral bundles of every foot and on the dorsal ramus of the posterior feet.

*Length.* 80 mm. by 6 mm.

*Colour* Dark-brownish red, with a dark spot at the base of the dorsal rami

*Occurrence.* Mergui, Gulf of Mannar, Pambam, Karachi.

*Distribution:* Macassar Straits, Annam, Bay of Bengal; Arabian Sea; Persian Gulf, Red Sea.

155. *Leonnates decipiens* Fauvel (Fig 87).

*Leonnates decipiens*, Fauvel, 1929, p 180, 1930a, p 20, fig 5, f-m

*Leonnates jousseaumei* (non Gravier), Fauvel, 1927b, p 427, fig 106, f, g

Body stout, a little flattened 80-90 segments Prostomium broader than long Four black eyes. Palps stout, divergent, as long as the tentacles Longer tentacular cirri reaching backwards to the 4th or 5th segment Jaws dark, curved, smooth on edge Maxillary ring with

Fig 87—*Leonnates decipiens* Fauvel a, foot from mid-body  $\times 30$ , b, posterior foot  $\times 30$ , c, d, falcigers from mid-body  $\times 600$ , e, f, long and short spinigerous bristles  $\times 600$ , g, articulation of heterogomph bristles  $\times 600$

small conical denticles, transparent, hardly visible I=0, II=an oblique row, III=a small transverse group, IV=a crescentic group Oral ring with soft conical papillae. V=0, VI=a single large papilla on each side, VII-VIII=a single row of 7-8 smaller papillae, sometimes more or less absent Dorsal ramus with three ligules, the upper triangular, with well marked dark glands,

the two lower ligules subequal, conical, smaller, dorsal cirrus on the base of the superior ligule and a little longer. Ventral ramus with two unequal fillets and a slightly longer, blunt, ligule, ventral cirrus tapering, shorter. In the posterior region, dorsal ramus much longer than the ventral. Dorsal setae all homogomph spinigers. Ventral setae, in the anterior and posterior feet, homogomph and hemigomph spinigers and shorter heterogomph ones. On the middle region from about the 13th and 15th setigerous segment, the ventral heterogomph spinigers are superseded by falcigerous setae the terminal piece of which has a spinous convex edge and an enlarged and abruptly truncated tip. *Even in the posterior feet, there are no dorsal falcigerous setae* and the ventral falcigerous setae are absent, in the anterior and posterior feet, in contradistinction to *jousseaumei* Gravier. Two long anal cirri.

*Length* 20–300 mm by 2 mm

*Colour* Colourless, in spirit

*Occurrence* Gulf of Mannar, Kiusadai, Pamban

*Distribution* Gulf of Mannar, Suez Canal

### Genus DENDRONEREIS Peters

Proboscis with only soft papillae. Prostomium deeply indented in front. *Dorsal cirrus of a number of anterior segments bearing numerous branchial filaments*. Ventral division of the feet multifid in the mid-body segments, more simple in the posterior ones. Setae all homogomph spinigerous.

#### *Key to the species of Dendronereis*

Branchial cirri pinnate	<i>arborifera</i> Peters, p 172
Branchial cirri bipinnate	<i>aestuarina</i> Southern, p 173

#### 156. *Dendronereis arborifera* Peters (Fig 86, c)

*Dendronereis arborifera*, Ehlers, 1868, p 578, pl XXII, figs 33–42. Fauvel, 1919, p 399, pl XV, figs 5–8, 1932, p 85.

Prostomium deeply cleft between the diverging tentacles, partly connected with the ovoid palpophores. Four eyes. Proboscis with soft conical papillae on both rings. Dorsal cirri bearing lateral simple branchial filaments from the 8th–10th to the 18th–22nd segment. In the anterior feet, dorsal division with two triangular lobes, ventral division with 4–6 conical lobes and a few papillae.

In the posterior feet, dorsal division bilobed, ventral division with a single large triangular lobe and a small ventral cirrus. Dorsal and ventral setae all homogomph spinigerous, nearly alike.

*Occurrence* Vizagapatam backwater and Canal

*Distribution* India, Madagascar, Mozambique

157 *Dendronereis aestuarina* Southern (Fig 86, b)

*Dendronereis aestuarina*, Southern, 1921, p. 598, pl. XX, fig. 4  
Fauvel, 1932, p. 86

Prostomium deeply indented in front, situated between the diverging tentacles and shorter than the tapering palps. Four large eyes. Proboscis with soft conical papillae on the basal ring. Maxillary ring devoid of papillae. Dorsal cirri bearing lateral pinnate gills, which commence on the 14th–15th foot. In the anterior feet the ventral division has a large number (15–19) of lobes, of which some form a fringe behind the setae. In the posterior feet, the dorsal division is bilobed and the ventral consists of two foliate lobes with a conical lobe between them, the ventral ligule and the ventral cirrus. Setae homogomph with long finely serrated terminal piece, which becomes shorter in the upper division of posterior feet.

*Length* 40 mm by 5 mm.

*Occurrence* Gangetic delta (in brackish water), Madras, Travancore

*Distribution* Taleh-Sap (Gulf of Siam), India

Genus **DENDRONEREIDES** Southern  
(emended)

Proboscis armed only with soft paragnaths. Dorsal setigerous lobe absent in first and second feet. In some of the anterior feet, gills are present in the form of numerous filaments situated below the dorsal cirrus; they are provided with vessels. Setae of two kinds, falcate homogomphs and spinose heterogomphs. In all the feet, except the anterior ones, there is a peculiar gland opening to the exterior beneath the dorsal cirrus. *The ventral ligule is absent.* In the post-branchial region the foot is greatly simplified.

158 *Dendronereides heteropoda* Southern (Fig. 86, *a*, 88).

*Dendronereides heteropoda*, Southern, 1921, p. 603, text-fig. 10*a*, *b*, pl. XXI, fig. 6, *a-n* Fauvel, 1932, p. 87, pl. II, figs. 3-9

Body long and slender. Prostomium broad, cleft between the small tentacles. Four eyes. Palps blunt, ovoid. Proboscis with a number of papillae on the maxillary ring, on the oral ring: V=3, VI=2-3 on each side, VII-VIII = two irregular rows. Anterior feet with dorsal and ventral cirri, 2-3 dorsal ligules and 3-4 ventral lobes.

Fig. 88—*Dendronereides heteropoda* Southern *a*, 25th foot  $\times 28$ , *b*, 34th foot  $\times 28$ , *c*, 4th foot  $\times 28$ , *d*, 8th foot  $\times 28$ , *e*, 11th foot  $\times 28$ , *f*, 15th foot  $\times 28$ , *g*, 18th foot  $\times 28$

Branchial region from 8th to 40th—50th setigerous segments, with clusters of more or less branched bunches of gills inserted below the dorsal cirrus and above the dorsal ligule, ventral division trilobed. In the posterior abranchiate feet, dorsal and ventral divisions each reduced to a single lobe. Homogomph spinigerous setae and homogomph

falcate setae with smooth terminal piece Two large anal cirri

In epitokous males the gills are more numerous and are present on a greater number of feet Posteriorly, the feet become longer and more simple The setae are very numerous, very long and slender Further back the feet and bristles become shorter again and the body is reduced to an elongated soft, white pouch, swollen with sperm Pygidium with a few short papillae

*Length* 60—135 mm

*Colour* Anterior region of the body rusty red. At the back of the head a narrow transverse band, or two elongate spots of brown pigment

*Occurrence.* Calcutta waterworks, Pulta Tanks, Bombay, Vallarpadan, Barantolla

*Distribution* India, Diamond Isles, Shat-el-Arab

### Genus NEREIS Cuvier.

Body vermiform, numerous segments Two tentacles Two ovoid palps Four eyes Four pairs of tentacular cirri. Proboscis with two horny, curved jaws and *conical horny paragnaths* Parapodia biamous, the first two setigerous segments excepted, which are uniramous Dorsal and ventral cirri Spinigerous and falcigerous compound setae Generally an epitocous stage, *Heteronereis*

### Subgenus NEREIS s. str.

Group V, or groups V and I of paragnaths absent.

#### 159. *Nereis anchylochaeta* Horst (Fig. 89, a—e).

*Nereis anchylochaeta*, Horst, 1924, p 155, pl XXX, figs 8—9  
Fauvel, 1931, p 20, pl II, figs 8—9, 1932, p 88

Proboscis: Group I = 3 in a longitudinal line, II = a crescentic row, III = 3 in a line; IV = a few, large, in a line, V = 0; VI = 0 or 1, VII—VIII = a single row of 2—3  
Dorsal ramus of the anterior feet with three sub-equal ligules In the middle and posterior feet, very large simple hooks in the upper and lower ventral bundle and small compound heterogomph falcigerous bristles The simple hooks are large falcate bristles whose terminal piece is fused with the shaft All transitional stages are met with between the clearly compound bristles and the large simple hooks

*Occurrence* Malacca Strait, Nankauri Harbour, amongst corals.

*Distribution* Malay Seas, Ambona, Malacca Strait, Annam, Nicobar Islands

160. *Nereis onychophora* Hoist (Fig 89, f-i).

*Nereis onychophora*, Horst, 1918, p 248, 1924, p 61, pl. XL, figs 12-14  
 Fauvel, 1932, p 89

*Nereis caenocirrus*, Chamberlin, 1919, p. 269, pl XXXIII, figs 7-8, pl XXXIV, figs 1-6, pl XXXV, figs 1, 2

Prostomium broad Two pairs of large eyes Proboscis. Group I=1-3, II & IV=crescentic clusters; III, a

Fig 89—*Nereis anchylochaeta* Horst a, b, ventral falcigers  $\times 176$ ; c, big half-compound bristle  $\times 175$ , d, e, simple bristles  $\times 184$   
*N onychophora* Horst f, posterior foot  $\times 70$ ; g, posterior dorsal hook  $\times 438$ , h, dorsal homogomph falciger from mid-body  $\times 438$ , i, anterior foot  $\times 70$

transverse cluster of 3-4 rows, V=0, VI=4-5, in a round group on each side, VII-VIII=2 irregular rows Dorsal ramus of the anterior feet with two subequal ligules and a small dorsal cirrus. Dorsal ligule enlarged in the posterior feet with subterminal cirrus In the middle and posterior feet only a single dorsal simple, large, hooked bristle and an aciculum In the ventral ramus spinigerous and small falcigerous bristles.

Length: 30 mm by 1 mm.

*Occurrence* Mergui, Jack and Una Islands

*Distribution* Marshal Islands, Malay Archipelago, Mergui

161. *Nereis chingrighattensis* Fauvel. (Fig 90, *a-h*).

*Nereis chingrighattensis*, Fauvel, 1932, p 90, text-fig 14.

Body cylindrical, tapering posteriorly, 80–100 segments. Prostomium not notched. Two pairs of black eyes disposed in a rectangle or a wide opened trapezium. Tentacles subulate, shorter than the large, conical, diverging palps. Peristomium somewhat longer than the succeeding segment. Tentacular cirri short, the posterior

Fig. 90—*Nereis chingrighattensis* Fauvel *a, b*, proboscis, ventral and dorsal view, *c*, 10th foot  $\times 35$ , *d*, 66th foot  $\times 35$ , *e, f*, lower ventral spinigers from 65th and 30th feet  $\times 380$ , *g, h*, ventral hemigomph spinigers from 30th and 65th feet  $\times 380$

ones reaching backwards to the 4–5th setiger. Jaws pale, curved, with 6–8 teeth. Paragnaths conical, yellow or nearly colourless. I = a cluster of 4–5, II = a crescentic group, III = a transverse group of 3–4 rows, IV = an oblique group of 3–4 rows, V = 0, VI = on each side, a transverse row of 15–20, with a few smaller outer denticles, VII–VIII = 2–3 irregular rows. Feet short, both rami

subequal Dorsal cirri subulate, shorter than the dorsal ligule Dorsal ramus with three ligules, two subequal, triangular and a shorter conical one Ventral ramus about the same length as the dorsal, with two fillets, the posterior one conical, the anterior one divided into two unequal lobes Inferior ligule blunt Ventral cirrus short subulate In the posterior feet the median ligule of the dorsal ramus decreases in size and the ventral fillets are nearly similar, the anterior being entire or faintly bilobed Setae numerous, slender, transparent, *all of them spinigerous* Dorsal setae homogomph, the ventral setae homogomph, with long terminal piece, and shorter hemigomph Lower ventral setae long hemigomph and short heterogomph Falcigerous setae absent in both rami Two long anal cirri

*Length* 50 mm by 2—3 mm

*Colour* Colourless in spirit, with the exception of 2—3 yellow glands in the feet.

*Occurrence* Creeks in Salt Water Lake, near Ching-righatta

162 *Nereis cricognatha* Ehlers (Fig 91, a—c).

*Nereis cricognatha*, Ehlers, 1904, p 29, pl IV, figs 3—7 Augener, 1913, p 163, 1924, p. 334; 1927, p 133 Horst, 1924, p 158 Fauvel, 1932, p 91

*Nereis arenaceodentata* Moore, Benham, 1916, p 134, pl. 46, figs 1—3

The proboscis carries numerous, horny paragnaths arranged in groups nearly fused together and forming a belt around the oral as well as the maxillary ring Group = 2, 3, II—III—IV are coalescent, V = 3, 4 or 5, VI = round clusters of 5—6, VII—VIII = *a broad belt more or less fused with V—VI forming a nearly complete ring* Dorsal ramus with two subequal ligules The posterior feet are not materially modified, the dorsal upper ligule being only larger than the lower, but not swollen or foliaceous, the dorsal filiform cirrus is inserted at the base The ventral falcigerous terminal pieces are all long, knife-like, with a small curved hook at the tip, they are homogomph. There are no dorsal falcigerous bristles on the posterior feet

*Length* 20—30 mm.

*Colour.* Colourless in spirit.

*Occurrence* Andaman Islands, shores of R. Hughly at Budge Budge, Calcutta waterworks; Gulf of Mannar

*Distribution* New Zealand, Bass Strait, Tasmania: Philippine Islands; India.

163 *Nereis glandicincta* Southern (Fig 91, f–h).

*Nereis glandicincta*, Southern, 1921, p 539, pl XXIII, fig 9  
Fauvel, 1932, p 92, 1939, p 314

Head narrow in front, wide behind with two short tentacles in front. Four eyes varying considerably in size, according to the state of maturity. Proboscis: Group I = 1–10 unequal, II = 6–13 large, curved, III = a transverse

Fig. 91—*Nereis cricognatha* Ehlers a, front view of the proboscis  $\times 14$ , b, 19th foot  $\times 23$ , c, falciger  $\times 875$  (after Ehlers) *N. trifasciata* Grube d, foot from mid-body  $\times 52$ , e, dorsal homogomph falciger  $\times 437$ . *N. glandicincta* Southern f, ventral falciger  $\times 437$ , g, foot from mid-body  $\times 70$ , h, posterior foot  $\times 70$

ly elongated band in 3–4 rows, IV = 6–12 large denticles, V = 0, VI = on each side one small denticle on a large rounded papilla, VII–VIII = a single row of a few minute denticles (occasionally missing altogether). Sometimes, the denticles of VI are very small, transparent and difficult to detect. Jaws slender. Posterior feet not material-

ly altered. Dorsal ramus with three slender lobes persisting in the posterior feet. Ventral ramus with setigerous lobe trifold in the anterior and middle feet, bifid in the posterior ones. Ventral falcigerous bristles homogomph, with long, knife-like, ciliate terminal piece. There are no posterior dorsal homogomph falcate bristles. Male *Heteronereis* with three distinct regions.

*Length* 50–90 mm

*Colour.* A girdle of yellow glands on each segment

*Occurrence.* Salt water lakes near Calcutta, from mud, Barantolla, Vizagapatam, Coasts of Cochin State.

*Distribution.* Gulf of Siam, Chantabun, Taleh Sap, Pulo Condore; Singapore, India.

164 *Nereis unifasciata* Willey (Fig 92, a–h)

*Nereis unifasciata*, Willey, 1905, p 271, pl IV, figs 85–88  
Ehlers, 1817, p 237 Horst, 1924, p 153, pl XXXI, figs 3–4  
Fauvel, 1930, p 522, fig 4, 1932, p 93

Fig 92—*Nereis unifasciata* Willey a, anterior part, b, c, proboscis, dorsal and ventral view, d, 10th foot  $\times 35$ , e, 40th foot  $\times 35$ , f, 63rd foot  $\times 35$ , g, upper ventral falciger from 63rd foot  $\times 450$ , h, lower ventral falciger from 52nd foot  $\times 450$

Longer tentacular cirri reaching backwards to 7th–12th segment. Proboscis: Group I=3–6 in a longitudinal line, II and IV=crescentic clusters, III=a rectangular cluster of 3 rows, V=0, VI=on each side, an oval or square cluster of 2–4 irregular rows, VII–VIII=a single row of 6–7 large paragnaths. Anterior feet with short

rounded lobes, two in each ramus. In the middle and posterior feet dorsal ramus with two sub-equal, triangular, diverging ligules, ventral ramus with a conical setigerous lobe and a narrow, blunt, inferior ligule. Heterogomph ventral falcigerous bristles with a short sickle-shaped terminal piece. *There are no posterior dorsal homogomph falcigerous bristles*, in contradistinction to *N. trifasciata* Grube, a closely allied species.

*Length.* 10–30 mm.

*Colour:* Rusty brown glands, in the feet and in a line across each segment.

*Occurrence.* Ceylon, Tuticorin

*Distribution* New Caledonia, Philippine Islands, Moluccas, Indo-China, India, Suez Canal

165. *Nereis trifasciata* Grube (Fig 91, *d, e*).

*Nereis unifasciata* (non Willey), Fauvel, 1919, p 397, 1921, p 7, XXI, figs 1–7 Augener, 1922, p 177, fig 3 Fauvel, 1932, p 95, 1935, p 106, 1939, p. 313

*Nereis unifasciata* (non Willey), Fauvel, 1919, p 397, 1921, p. 7, pl 1, figs 8–9

Long tentacular cirri reaching backwards to about the 7th segment. Proboscis Group I=0, II and IV=crescentic clusters, III=rectangular cluster, V=0, VI=on each side, a small cluster of 3–6, VII–VIII a single row of 2–7 small denticles. Anterior feet with short rounded lobes, two in each ramus. In the middle and posterior feet, dorsal ramus with two subequal triangular ligules, ventral ramus with a blunt setigerous lobe and a narrow conical inferior ligule. Dorsal cirri longer than the foot. Heterogomph ventral falcigerous bristles with a short sickle-shaped, smooth, or ciliated, terminal piece. *In the posterior feet, a dorsal homogomph falcigerous bristle*, with more or less elongated straight terminal piece.

*Length.* 10–30 mm

*Colour* Dark brown transverse streaks on the anterior segments. Dorsal glands in the feet

*Occurrence* Maldivé Archipelago

*Distribution* China Sea, Philippine Islands; Indo-China; Maldivé Archipelago, Madagascar, Red Sea, Juan Fernandez

166 *Nereis talchisapensis* Fauvel (Fig 93, (a-h).*Nereis talchisapensis* Fauvel, 1932, p 93, pl II, figs 10-17

Body stout, cylindrical, tapering posteriorly 80 segments and more. Prostomium short and broad. Four eyes, of medium size, arranged in a wide-open trapezium. Two small tentacles, separated from each other at their base by the anterior rounded border of the prostomium; they are about as long as the palpophores. Palps short, large,

Fig 93—*Nereis talchisapensis* Fauvel a, anterior end, dorsal view, enlarged, b, proboscis, ventral side, enlarged, c, proboscis, dorsal side, enlarged, d, inferior falcigerous bristle from posterior foot  $\times 350$ , e, joint of inferior ventral hemigomph bristle  $\times 350$ , f, 70th foot  $\times 42$ , g, 10th foot  $\times 42$ , h, 30th foot  $\times 42$

conical, diverging. Peristomium larger than the following segment. Upper tentacular cirri long and slender, the posterior ones reaching backwards to the 7th-11th setigerous segment. the inferior ones subequal, hardly over-reaching the second setigerous. Jaws clearly denticulate. Proboscis. Paragnaths conical, group I=2, one behind the other, II-IV=crescentic clusters, III=rect-

angular cluster of 3–4 rows, V=0, VI=on each side, 4–5 large ones crosswise or in an irregular cluster, VII–VIII=3–4 irregular rows of large conical denticles. Parapodia elongated, with somewhat slender divisions, posterior feet hardly altered. In the anterior feet, dorsal ramus with a long cirrus, three sharp pointed ligules, *the upper one shorter than the two inferior ones, borne on an elongated common base*. Ventral ramus with two unequal lobes or fillets, the anterior conical and the posterior rounded and much shorter, an inferior ligule as long as the conical fillet, a slender and short ventral cirrus. In the posterior feet, the median dorsal ligule disappears after having progressively decreased in size, the upper ligule is not enlarged. Dorsal setae homogomph spinigerous, upper ventral setae homogomph spinigerous and long hemigomph falcigerous, lower ventral setae hemigomph spinigerous, and heterogomph falcigerous, with an elongated terminal piece, ciliated and ending in a curved hook connected to the edge by a ligament. There are no dorsal homogomph falcigerous bristles in the posterior feet. Acicula rather pale. Two long, filiform, anal cirri.

*Length* About 15–20 mm by 3–4 mm., feet included

*Colour* Discoloured in spirit.

*Occurrence* Taleh-Sap, Gulf of Siam

167. *Nereis chilkaensis* Southern (Fig. 94, a–c)

*Nereis chilkaensis*, Southern, 1921, p. 584, pl. XXII, fig. 8. Fauvel, 1932, p. 94

Head considerably narrower in front than behind. Prostomium projecting a little in front between the tentacles. Palps large and stout. Posterior tentacular cirri reaching back to 6–8th and even 12th segment. Proboscis. Group I=6–10, II=18–20; III=a cluster of 26–34; IV=triangular cluster, V=0, VI=on each side an irregular curved row of 3–7, VII–VIII=two alternating irregular rows. Anterior feet, dorsal ramus with a long cirrus, three ligules, ventral ramus with a long cirrus, three ligules, ventral ramus with a fillet produced outwards into two conical lobes, a blunt ligule and a short ventral cirrus. In the posterior feet, the dorsal ramus is relatively larger and more prominent than the ventral ramus, but the upper ligule is not enlarged and foliaceous. Falcate heterogomph setae with moderately, long terminal pieces,

smooth at the tip, spinose below. There are no dorsal homogomph falcigerous bristles in the posterior feet.

Fig 94—*Nereis chilkaensis* Southern a, 40th foot  $\times 45$ , b, anterior foot  $\times 45$ , c, falciger *N. reducta* Southern d, head and proboscis, e, proboscis, ventral view, f, 60th foot, g, lower falciger (after Southern)

**Length.** 40–100 mm. About 80 segments

**Colour** Dorsum deeply coloured with purplish brown pigment, dark in front and growing paler behind

**Occurrence:** Chilka Lake, Ennur backwater, Pamban, Madras Coast, Travancore

### 168 *Nereis indica* Kinberg.

*Nereis indica*, Kinberg, 1865, p 160 Willey, 1905, p 970

Fauvel, 1930a, p 24, 1932, p 96

*Nereis* sp near *ezoensis*, Gravelly, 1927, p 13, pl X, fig 22

**Proboscis.** Group I=1 or 0, II=two curving rows, III=a lozenge shaped cluster, IV=triangular clusters, =0, VI = on each side, a rounded cluster of 4–6, VII–VIII=1 or 2 large rows and a row of numerous minute denticles. Tentacular cirri short. Dorsal ramus of the anterior feet trilobed. Posterior feet not modified, their upper ligule is not strongly enlarged. Ventral heterogomph falcigerous bristles with sickle-shaped terminal

pieces There are no posterior dorsal homogomph falcigerous bristles

*Length* 50 mm

*Occurrence* Galle, Pamban, Waltair beach

*Distribution* Bangka Straits, Ceylon, Gulf of Mannar

169 *Nereis coutierei* Gravier (Fig 95, i, k).

*Nereis coutierei*, Gravier, 1901, p 167, pl XI, figs 36-41 Fauvel, 1932, p 96, 1939, p 312

Body slender, small size Prostomium not notched. Proboscis group I=1, II and IV=small clusters, III=a small transverse cluster, V=0, VI=on each side, a small rounded cluster of 5-7, VII-VIII=a single row of 6-8 far apart In the anterior feet, dorsal ramus with two conical equal ligules and a long dorsal cirrus Ventral setigerous lobe blunt, rounded In the posterior feet, the *dorsal ligule is enlarged into a rounded crest* Ventral heterogomph falcigerous bristles with short sickle-shaped terminal piece *Dorsal homogomph falcigerous bristles*, not boldly denticulate, in the posterior feet

*Length* 15-25 mm.

*Occurrence* Andaman Islands, weed washings, Gulf of Mannar, Addu Atoll

*Distribution* Indo-China, Indian Ocean, India, Persian Gulf, Red Sea, Suez Canal

170. *Nereis zonata-persica* Fauvel (Fig. 95, f-h)

*Nereis zonata-persica*, Fauvel, 1911, p 385, pl XIX, figs 10-16, pl XX, figs 24-25, 1932, p 96, 1939, p 312 Puvion, 1930, p 47, pl III, figs 65-68

Body rounded Proboscis. Group I=0 or 1; II-IV=crescentic clusters, III=transverse cluster of 2-3 rows, V=0, VI=on each side, a rounded or oval cluster of 6-10, VII-VIII=an anterior row of rather large denticles and 2-5 irregular rows of numerous small denticles Dorsal ramus with a long cirrus and two conical sub-equal ligules Ventral setigerous lobe short, rounded Posterior feet not materially modified, dorsal ligule not enlarged Ventral heterogomph falcigerous bristles with short sickle-shaped terminal piece In the posterior feet, large *homogomph dorsal falcigerous bristles with bi- or tridentate end-pieces*.

*Length* 15-30 mm.

**Occurrence** Pamban, Mormugao Bay

**Distribution** New Caledonia, Indo-China, Indian Ocean, Persian Gulf, Red Sea

**Remarks.** It is really a distinct species and not a simple variety of *N. zonata* as I first described it

171 *Nereis kauderni* Fauvel. (Fig 95, a—d).

*Nereis kauderni*, Fauvel, 1921, p 8, pl I, figs 1—7, 1932, p 97, 1939, p 311

*Nereis falcaria*, Gravelly, 1927, p 12, pl X, fig 20

*Nereis mortenseni*, Augener, 1923b, p 21, figs 7—14, 1924, p 319, fig 4

(?) *Ceratonereis falcaria*, Willey, 1905, p 272, pl IV, fig 89

Body small, cylindrical, slender *Prostomium* notched between the tentacles Tentacular cirri short Proboscis Group I=0, II=a more or less irregular row, III

Fig 95—*Nereis kauderni* Fauvel a, anterior part  $\times 10$ , b, posterior foot  $\times 40$ , c, d, dorsal homogomph falcigers  $\times 333$  *N. jacksoni* Kinberg e, dorsal homogomph falciger  $\times 333$  *N. zonata-persica* Fauvel f, g, dorsal homogomph falcigers  $\times 333$ , h, foot from mid-body  $\times 26$  *N. coulteri* Gravier i, dorsal homogomph falciger  $\times 333$ , k, posterior foot  $\times 40$

=a variable cluster, IV=a crescentic group, V=0, VI=on each side, a small cluster of very minute paragnaths, VII—VIII=a single row of 8—9 denticles Dorsal cirri longer than the foot Dorsal ramus with two conical subequal ligules. Ventral setigerous lobe blunt In the

posterior feet, the dorsal ligule is much reduced. Ventral heterogomph falcigerous bristles with sickle-shaped ciliate terminal piece. In the middle and posterior feet, 1–2 large homogomph falcigerous bristles with prominent bi- or tridentate terminal piece

*Length:* 15–30 mm

*Colour* A pattern of elongated transverse pigment spots on the anterior segments

*Remarks* Although much alike, its identity with *Ceratonereis falcaria* Willey is very doubtful, since in the latter the paragnaths are missing on the oral ring, according to Willey. But they might have been overlooked (?).

*Occurrence* Gulf of Mannar, Tuticorin, Maldives Archipelago

*Distribution* Pacific Ocean, Australia, New Zealand, New Caledonia, Indo-China, Indian Ocean, India, Maldives Archipelago

## 172 *Nereis jacksoni* Kinberg (Fig 95, e)

*Nereis jacksoni*, Kinberg, 1865, p. 69. Augener, 1922, p. 18. Pruvot, 1930, p. 44. Fauvel, 1930b, p. 524, 1932, p. 97.

*Nereis denhamensis*, Augener, 1913, p. 156, pl. III, fig. 51. Fauvel, 1917, p. 204, pl. VI, figs. 45–46.

*Nereis heurissonensis*, Augener, 1913, p. 159, pl. III, fig. 52.

(?) *Ceratonereis falcaria*. (non Willey), Benham, 1916, p. 136, pl. 46, figs. 4–10.

Body small, cylindrical, slender. *Prostomium* not notched between the tentacles. Tentacular cirri short. Proboscis group I=0, II=two curved rows, III=a transverse cluster, IV=on each side, crescentic clusters, V=0, VI=on each side a small cluster of very small denticles, VII–VIII=a single row of about 7, wide apart. Dorsal ramus with two conical, subequal ligules. Dorsal cirri longer than the foot. Ventral setigerous lobe blunt. In the posterior feet, the dorsal ligule is more or less reduced. Ventral heterogomph falcigerous bristles with sickle-shaped ciliate terminal piece. In the middle and posterior feet, 1–2 large homogomph falcigerous bristles with prominent bi- or tridentate terminal piece.

*Remarks* Differs chiefly from *N. kaudeerni* Fauvel in having its prostomium not notched.

*Length* 15–30 mm

*Colour* Dorsal pattern variable

*Occurrence* Andaman Islands, Kilakarai; Maldives Archipelago

*Distribution* Pacific Ocean, Australia, New Zealand, New Caledonia, Indo-China, Bay of Bengal, Arabian Sea

173 *Nereis reducta* Southern (Fig 94, d–g).

*Nereis reducta*, Southern, 1921, p 593, pl XXI, figs 7a–7k

Body narrow. Palps long and pointed. Eyes small. Tentacular cirri rather short. Proboscis. Group I = a single large paragnath, II=6 of varying size, III=11, IV=8–10, V=0, VI=minute paragnaths, VII–VIII= numerous paragnaths in longitudinal rows. Anterior feet with short fusiform, dorsal and ventral cirri, two upper and two lower lobes. In the posterior feet the upper dorsal lobe is much reduced in size and is smaller than the median ligule. The dorsal setae are few and the spinous heterogomph setae occur singly in the middle and posterior segments. The falcate setae have tips nearly straight and of medium size.

*Length* 50 mm. 96 segments.

*Colour* Head and anterior segments pale brown

*Occurrence* Chilka Lake, about a mile inside the mouth. Only a single specimen

174 *Nereis gisserana* Horst (Fig 96, e–i).

*Nereis gisserana*, Horst, 1924, p 151, pl XXX, figs 6–7. Monro, 1939, p 394, fig 302

Palps short and stout. Tentacular cirri very long, the longest reaching back about the 15th setiger. Proboscis. Group I=0; II=a transverse row of about 5, III=three groups, a middle one of three rows of small paragnaths and two lateral groups each of two, IV=a small patch of rather larger denticles, V=0, VI, on each side, 3 in a transverse row, VI–VIII=a single row of 5–6, widely separated. In the anterior region, the lobes of the feet are short and blunt, but they gradually lengthen from

before backwards. Dorsal ramus with two unequal conical lobes and long dorsal cirrus. The shorter lower dorsal languet is fused for part of its length with a slightly middle languet. Ventral ramus much shorter, especially in the posterior feet where the dorsal ramus greatly overshadows the ventral, but there is no special development of the upper dorsal languet. Heterogomph falcigers with short and broad end-piece, which becomes longer and hooked in the posterior feet.

Fig 96—*Nereis heteromorpha* Horst a, posterior foot (after Horst) *N. (Neanthes) capensis* Willey b, foot from mid-body, c, d, proboscis dorsal and ventral view *N. gisserana* Horst e, f, proboscis, dorsal and ventral view, g, foot from mid-body, h, falciger from mid-body, i, falciger from hinder foot (after Monro)

Length 45 mm by 2 mm

Occurrence Maldives Archipelago

Distribution Malay Archipelago, Maldives Archipelago, Amirante Islands.

175 *Nereis longilingulis* Monro (Fig 97, a-c)*Nereis longilingulis*, Monro, 1937, p 277, fig 9

Body much tapered behind Head longer than broad, not incised between the tentacles Palps stout, about equal to the tentacles Proboscis without paragnaths in the larger specimens In the small ones, group I=0, II=small crescentic patches, III=a transverse row of 4 relatively large paragnaths, IV=small crescentic patches, V=

Fig 97—*Nereis longilingulis* Monro a, 20th foot, b, ventral falciger from mid-body, c, ventral falciger from hinder region (after Monro)

*N* (*Ceratonereis*) *burmensis* Monro d, 10th foot, e, hinder foot, f, falciger (after Monro)

0, VI=a single small one on each side, VII=a single small one, VIII=0 Anterior feet with two triangular lobes in each ramus, median feet with two dorsal flagelliform languets longer than the dorsal cirrus, in the ventral ramus the lips of the chaeta-sac and the ventral languets are prolonged into a long slender process At the 70th setiger all the languets are slender, but very much reduced in length Ventral hemigomph falcigers with a long, straight blade, shorter in the posterior feet There are no dorsal homogomph falcigers

Length: 45 mm. by 2 mm

80 setigers

*Remarks* Differs from *C. flagellipes* Fauvel in having one, and not two, flagelliform processes arising from the ventral chaeta-sac, different blades to the falcigers, and paragnaths on both rings of the proboscis

*Occurrence* North Arabian Sea

*Distribution* Arabian Sea.

176 *Nereis heteromorpha* Horst (Fig 96, a)

*Nereis (Lycoris) heteromorpha*, Horst, 1924, p 152, pl XXXI, figs 1-2 Augener, 1926, p 449

Male *Heteroneis* with body divided into three regions Anterior atocous part with 14 segments, epitocous part with 32-45 segments, posterior part atocous, with reduced lobes having neither lamellae nor swimming bristles Head with two pairs of large coalescent eyes, tentacles and palps bent backwards under the head. Tentacular cirri rather short. Dorsal cirri of the anterior seven parapodia swollen below the tip In the epitocous parapodia the dorsal ligule is conically elongated, whereas the ventral one has a lamella-shaped distal extremity, a rather large fan-shaped lamella is situated at the base of the dorsal cirrus which bears, along its ventral border, 14 papillae Ventral cirrus provided ventrally with a large lamella and, dorsally, with an elongated one, the neuropodial lobe bears a large cordiform lamella In the caudal region, a dorsal, stout, pale aciculum and a ventral blackish one Proboscis Group I=1-2 paragnaths behind one another, II=a crescentic cluster, III=a transverse curved group in 3-4 rows, IV=a curved triangular one, V=0, VI=on each side, a transverse row of 5-6 denticles, VII-VIII=a monostichous belt of 12 paragnaths

*Length* 8-10 mm *Atocous phase unknown*

*Occurrence*: Ceylon, Trincomali

*Distribution* Malay Archipelago, India

Subgenus NEANTHES Kinberg.

All groups of the proboscis present

177. *Nereis (Neanthes) capensis* Willey (Fig 96, b-d)

*Neanthes capensis*, Willey, 1904, p 261, pl XIII, fig 10, pl XIV, figs 9-10 Fauvel, 1911, p 384

*Neanthes albanyensis*, Augener, 1913, p 149, pl II, fig 6 Fauvel, 1917, p 206, fig 16, 1927, p 430

Longer tentacular cirri reaching backwards to the 7th–11th segment Proboscis Group I=1 or 2, II=triangular clusters, III=a transverse cluster, IV=rectangular cluster, V=1 or 3, VI=on each side, a cluster of 3–6, VII–VIII=3–4 rows Anterior feet with short rounded lobes, 3 in the dorsal ramus, and short dorsal cirri Middle and posterior feet with sharper lobes, dorsal lobes not increased End-pieces of the falciform heterogomph setae small, short, broad There are no posterior dorsal homogomph falcigerous bristles

*Length* 30 mm by 5 mm

*Colour* Two dark glands in the feet

*Occurrence* Persian Gulf

*Distribution* Australia, New Zealand, Persian Gulf, Suez Canal, Cape of Good Hope

#### 178 *Nereis* (*Neanthes*) *meggitti* Monro

*Nereis* (*Neanthes*) *meggitti*, Monro, 1931, p 580, figs 1–6

Prostomium as broad as long The longest tentacular cirri reach back to the 7th–10th setiger Proboscis Group I=a cluster of 4 very small paragnaths, II=oblique clusters of 10–12 small ones, III=about 4 rows of numerous small, IV=oblique groups of about 15, V=a group of 4–6 rather large ones, VI=4–5 rather large paragnaths, on each side, VII–VIII=a continuous band of 4 rows of small paragnaths In the anterior feet, dorsal ramus with three triangular, pointed, upper lobes of about equal size Dorsal cirrus slender In the posterior segments, there is no substantial enlargement of the upper dorsal lamella but, relatively to the dorsal ramus, the ventral ramus is much reduced There are no dorsal homogomph falcigers

*Length* 30 mm by 2 mm

*Colour* Male and female *Heteronereis* In spirit, vestiges of a narrow black stripe down the middle of the back

*Occurrence* Rangoon River, forty miles from the mouth, in fresh water

### Subgenus CERATONEREIS Kingberg

Paragnaths missing on the oral ring

#### 179. *Nereis* (*Ceratonereis*) *costae* Grube (Fig 98, a–f)

*Nereis* (*Ceratonereis*) *costae*, Fauvel, 1923, p 349, fig 136 a–f, 1939, p 320

*Nereis* (*Ceratonereis*) *fasciata* Grube, Gravier, 1901, p 174, pl XXI, figs 45

*Nereis* (*Ceratonereis*) *lapmogensis*, Grube, 1878 p 69

*Ceratonereis pectinifera* Grube, Willey, 1905, p 272, pl IV, figs 90-91

Tentacular cirri rather short. Prostomium not incised. Proboscis Group I=0, II=2 crescentic rows, III=3-8, set in a triangle or a lozenge, IV=square clusters. In the anterior feet, three dorsal ligules, the median one shorter. In the posterior feet the dorsal ramus over-

Fig 98—*N* (*Ceratonereis*) *costae* Grube a, b, head and proboscis, c, d, 11th and 18th feet  $\times 20$ , e, posterior foot  $\times 20$ , f, falciger  $\times 350$  *G hircinicola* (Eisig) g-h (not yet found in India)

shadows the ventral one. Dorsal cirrus longer, ventral cirrus short. Posterior ventral falcigerous bristles with a stout yellow shaft and a hooked end-piece. There are no dorsal homogomph falcigers.

*Length* 20-80 mm

*Colour* Very variable, yellowish, pink, green, with streaks of brown dots

*Occurrence* Ceylon

*Distribution* Australia, Philippine Islands, Indo-China, Malay Archipelago, Indian Ocean, Red Sea, Persian Gulf, Atlantic Ocean

180. *Nereis (Ceratonereis) pachychaeta* Fauvel. (Fig. 99, a-h).

*Ceratonereis pachychaeta*, Fauvel, 1919, p. 403, fig. VIII, pl. XV, figs 22-25, 1923, p. 41, 1933, p. 57

Body short, tapering backwards. Prostomium not notched. Tentacular cirri short. Proboscis. Group I = 1, II = 4-8 in a single, curved, row, III = 2-3 behind one another, IV = triangular clusters of 4-6. Dorsal cirri slightly longer than the feet. Anterior feet with three

Fig. 99—*N. (Ceratonereis) pachychaeta* Fauvel. a, anterior part  $\times 8$ , b, anterior foot  $\times 30$ , c, posterior foot  $\times 30$ , d, foot from mid-body  $\times 30$ ; e, large upper ventral falciger  $\times 300$ , f, g, heterogomph and homogomph articulations  $\times 300$ , h, lower ventral falciger from 20th foot  $\times 300$ .

dorsal, sub-equal, rounded ligules. In the posterior feet, two dorsal, unequal, pointed ligules, ventral ramus shorter, with several very stout heterogomph falcigers with end-piece hooked and more or less fused with the stalk. Lower falcigers with shorter hooked end-piece not fused.

Length: 30-45 mm. by 3-4 mm.

Colour. In spirit, copper coloured with transverse bands of tiny dark spots and dark glands.

Occurrence. Maldive Archipelago, Hulu Male.

Distribution. Tahiti, Gambier Islands; Maldive Archipelago, Red Sea, Gulf of Suez, Madagascar.

181. *Nereis (Ceratonereis) burmensis* Monro. (Fig. 97, d-f).

*Nereis (Ceratonereis) burmensis*, Monro, 1937b, p. 532, fig. 1

Prostomium not incised Palpostyles small, button-like Four small black eyes in a rectangle Longer tentacular cirri reach back to the 6th setiger. Proboscis No paragnaths on the proximal ring, Group I=a patch of very small paragnaths, II=narrow oblique clusters of relatively large ones, III=a rather wide transversal band of about three rows of very small denticles, IV=an oblique cluster of about 10 Short subulate cirri Dorsal ramus with 3 triangular ligules Ventral ramus with 4 languets, but only 3 in the posterior feet, which are not increased Bristles delicate and slender Ventral falcigers with long, straight, slender end-piece *they are confined to a short median region*. Further back there are only spinigers There are no dorsal homogomph falcigers *Heteronereis* male with modification of the feet at about the 21st setiger

Length 45 mm by 2 mm.

Colour. In spirit, grey-green, with a black median dorsal stripe over about the first ten setigers and traces of black transverse segmented bands Black pedal glands

Occurrence. Off Bombay; Maungmagan, Burma.

Remarks Feet very close to *N. chingrighattensis* Allied to *Ceratonereis similisetis* Grube, which has no falcigers and a different shape of feet

182 *Nereis* (*Ceratonereis*) *tripartita* Horst. (Fig. 100, a-d)

*Nereis* (*Ceratonereis*) *tripartita*, Horst, 1924, p 183, pl. XXXVI, figs. 1-2 Fauvel, 1932, p 99, fig 15.

Fig. 100.—*N. (Ceratonereis) tripartita* Horst: a, 9th foot  $\times 45$ ; b, heterogomph falciger from hinder foot  $\times 400$ ; c, upper ventral falciger from 9th foot  $\times 400$ ; d, lower ventral falciger from 9th foot  $\times 400$ .

Tentacular cirri reaching backwards to the 8th—9th segment Proboscis Group I = 0, II and IV = triangular clusters of numerous small, pale paragnaths, III = a large transverse cluster of several rows. In the anterior feet, a dorsal cirrus longer than the foot, two sub-equal sharp conical dorsal ligules Ventral setigerous lobe short and blunt, ventral cirrus long and slender Posterior feet not increased Homogomph and heterogomph spinigerous bristles Ventral heterogomph falcigerous bristles with sickle-shaped, ciliate, terminal piece, some of them very stout, but compound There are no posterior dorsal homogomph falcigerous bristles Atocous specimen, those of *Hoist* were all epitocous, divided into three regions

*Occurrence* Andaman Islands, in coral.

*Distribution* Malay Archipelago; Andaman Islands

183 *Nereis* (*Ceratonereis*) *microcephala* Grube. (Fig. 101, *a—b*)

*Nereis* (*Ceratonereis*) *microcephala*, Grube, 1878, p. 65 Fauvel, 1932, p. 99, fig. 16

Prostomium small, not notched between the tentacles Four black eyes arranged in a widely opened trapezium

Fig 101 —*N* (*Ceratonereis*) *microcephala* Grube *a*, foot from mid body  $\times 60$ , *b*, 20th foot  $\times 60$

Tentacles shorter than the palpophores which are very large, blunt, conical and diverging Two inferior pairs of tentacular cirri shorter than the upper ones, which reach backwards to the 7th—8th segment. Proboscis Maxillary ring small, oral ring (devoid of paragnaths) much larger Group I = 0, II = crescentic clusters of 2—3 rows, III = a broad and transverse cluster of 3—4 irregular rows, IV = several curved rows The posterior feet are not

modified. In the anterior feet, dorsal ramus with two triangular subequal ligules and dorsal cirrus about the length of the ligules. Ventral setigerous lobe conical, as long as the dorsal ramus, ventral ligule blunt and much shorter. Ventral cirrus small, much shorter than the ventral ligule. Dorsal and upper ventral spinigerous bristles homogomph, lower ventral ones heterogomph. All setae long and slender. Falcigerous homogomph. Ventral setae present in anterior feet, missing in the posterior ones.

Differs from *C. tripartita* in (1) the shape of the feet which are shorter and more blunt, (2) its very much shorter ventral cirrus, and (3) the absence of posterior ventral falcigerous bristles and in its more slender setae. The armature of the proboscis is the same.

*Occurrence* Taleh-Sap, Gulf of Siam

*Distribution* Philippine Islands, Gulf of Siam.

184 *Nereis* (*Ceratonereis*) *flagellipes* Fauvel (Fig 102, a-h)

*Nereis* (*Ceratonereis*) *flagellipes*, Fauvel, 1932, p 100, pl III, figs 1-8

Prostomium broader than long, not notched between the tentacles. Four rather large eyes, with a lens, arranged in a widely opened trapezium. Tentacles about the length of the palpophores. Palps stout, ovoid. Tentacular cirri rather short, the longer reaching backwards to the 6th setigerous segment. Peristomium hardly longer than the succeeding segment. Jaws very pale yellow, transparent, with 5-6 teeth, the inferior ones blunt. Paragnaths missing on the oral ring. On the maxillary ring they are sharply conical, transparent, little conspicuous. Group I=0 (or 1?), II=small clusters of 3-4; III=a transverse row of 3, IV=small clusters of 2-5. Paropodia. On the first 5-6 setigerous segments, the dorsal cirrus is more or less of the same length as the dorsal ligule. The dorsal and ventral rami are divided each into two elongated conical ligules whose tip is already slightly filiform in the upper dorsal one. The ventral cirrus is shorter. In the succeeding feet, the dorsal ligules become flagelliform (whip-like) and much longer than the cirrus. In the ventral ramus, the setigerous lobe is much elongated and divided at the tip into two filiform appendages corresponding to the two fillets. The ventral ligule is whip-like and nearly as long as the dorsal ligules, and the ventral cirrus is much shorter. Behind the 20th foot, the ligules still increase in length, especially the

ventral one, and are more or less coiled (The posterior feet are unknown) The dorsal bristles are slender homogomph spinigers The upper ventral bristles are long and slender homogomph spinigers and heterogomph falcigers, the lower ventral ones are hemigomph, or faintly heterogomph, spinigers and long heterogomph falcigers.

Fig 102—*Nereis* (*Ceratonereis*) *flagellipes* Fauvel a, anterior end, dorsal view, b, proboscis, ventral view, c, 5th foot, d, 21st foot, e, 35th foot, f, homogomph spinigerous bristle, g, inferior falcigerous bristle from posterior foot, h, inferior falcigerous bristle from anterior foot

Only a single anterior fragment, 32 mm by 2 mm and 36 segments, was collected.

*Occurrence* 25 miles south of Barwa Beacon, Ganjam Coast, 93 fms.

185. *Nereis* (*Ceratonereis*) *mirabilis* Kinberg (Fig 103, a-c)

*Ceratonereis mirabilis*, Kinberg, 1865, p 70 Ehlers, 1887, p 117-172, pl XXXVIII, fig 1-6 Gravier, 1901, p 172, pl XI, fig 12 Fauvel, 1917, p 207 (Synonymy), 1932, p 98 Gravelly, 1927, p 13, pl X, fig 21.

*Ceratonereis tentaculata* Kinberg, Augener, 1913, p 168 Horst, 1924, p 180, pl XXXV figs 4-7

Prostomium deeply cleft between the tentacles Palps elongated Tentacular cirri and dorsal cirri very long Proboscis Group I=0, II and IV=triangular clusters, III=a transverse cluster of several rows Paragnaths missing on the oral ring Dorsal ramus with two long, slender, subequal ligules Posterior feet little modified Spinigerous setae homogomph and heterogomph Falcigerous setae heterogomph, with long, straight, ciliated

Fig 103—*N* (*Ceratonereis*) *mirabilis* Kinberg a, 40th foot  $\times 80$ , b, head, c, upper ventral falciger  $\times 500$  *Perinereis barbara* Monro d, e, proboscis, ventral and dorsal view  $\times 6$ , f, anterior foot  $\times 25$

terminal piece, becoming shorter and more sickle-like in the posterior feet Dorsal homogomph falcigerous bristles in the posterior feet

Length. 30 mm.

Colour. In life, semi-transparent

Occurrence. Andaman Islands, Gulf of Mannar, Krusadai Island, Pamban, Kilakarai, from coral reefs, Maldivé Archipelago

Distribution. Pacific Ocean; Indian Ocean, Persian Gulf, Red Sea, Atlantic Ocean, Brazil, West Indies.

Genus *PERINEREIS* Kinberg

Parapodia biramous Horny paragnaths on both rings of the proboscis Paragnaths of Group VI transverse, ridge-shaped, or a transverse row of more or less flattened denticles

186 *Perinereis maindroni* Fauvel (Fig 104, e-i)*Perinereis maindroni*, Fauvel, 1943, p 201, fig 1, e-i

Body small, slender, divided into three regions. Four eyes set in a trapezium. Tentacles shorter than the conical palps. The longer dorsal cirrus reaches back to the third setigerous segment. Proboscis with very small, transparent, conical paragnaths, not easily detected. Group I=1 or 0, II and IV=curved rows, III=a small transverse cluster, V=0, VI=on each side, a transverse row of 5-6 conical or slightly flattened paragnaths, VII-

Fig 104—*Perinereis maindroni* Fauvel e, f, long and short spinigers  $\times 380$ , g, anterior foot  $\times 80$ , h, foot from mid-body  $\times 80$ , i, semi-epitocous foot  $\times 80$

VIII=3 rows. *Anterior region* with a score of segments, the feet of which carry three dorsal subequal ligules and three ventral ones, with the intermediate one shorter. Dorsal cirrus about the same length as the upper ligule. Ventral cirrus short. *Middle region* 20-24 segments. Dorsal ligule narrow, and about twice or thrice as long as the two others and the dorsal cirrus, which is inserted at its base. *Posterior region* 12-15 segments, the last ones very small. The dorsal ligule decreases rapidly

Setae very small and slender. Falciform endpieces rather long and slender. There are no homogomph falcigers. Two long anal cirri.

*Length* 15–18 mm

*Colour* In spirit yellowish, with, sometimes, a brown collar behind the head and a few streaks on the back of the anterior segments.

*Occurrence* Pondichery (M. Maindion col.).

*Remarks* One of the specimens is a sub-epitocus male, with incipient lamellae on the ventral cirrus, but without oar-shaped setae. The others, though atocous, are nevertheless clearly divided into three regions, which is very unusual in atocous Nereids.

187. *Perinereis barbara* Monro. (Fig. 103, d–f).

*Perinereis barbara*, Monro, 1926, p. 316, figs 3–5

Prostomium of the usual shape. Longest tentacular cirri reach back to the third setiger. Proboscis Group I = 2 paragnaths, a smaller followed by a larger; II = an oblique distichous group of about 12 paragnaths, III = a small transverse group of about 9, IV = a large crescentic group, V = a longitudinal row of 4 paragnaths, VI = 2 small paragnaths on the border of group V and a single larger linear paragnath, on each side, VII–VIII = a band of paragnaths about four deep (Variations occur in group VI). Anterior feet with long dorsal cirrus and two dorsal lobes, the lip of the ventral seta-sac is just shorter than the inferior one. Ventral languet sub-digitiform. Posteriorly the languets all become longer and more pointed. There is nothing remarkable about the setae and their arrangement, except that there appear to be no heterogomph spinigers present.

*Length*. 40 mm. by 2 mm.

*Colour*. In spirit, pale yellow

*Occurrence*. Singapore Beach

*Distribution*. East Australia, Port Jackson, Singapore

188 *Perinereis suluana* Horst (Fig. 105, e)

*Perinereis suluana*, Horst, 1924, p. 175, pl. XXXIII, fig. 9. Monro, 1926, p. 318. Fauvel, 1932, p. 102

Posterior tentacular cirri, rather slender and streaked with brown pigment, reach backwards to the 4th setigerous segment. The palps, longer than the tentacles, are

stout and cylindrical. The eyes are large, black, with a lens, and set in a square. Proboscis group I=2-3 in a line, II and IV=clusters, III=a transverse cluster of 3-4 rows, V=0, VI=on each side, a single ridge-shaped paragnath. *Groups VII-VIII absent*. In the posterior feet, the dorsal ligule is larger and protrudes above the ventral ramus but is not foliaceous and flag-like. Falcigerous setae with a short terminal piece.

*Colour* Prostomium white with three longitudinal brown streaks. Back dark-brown with a narrow white line across the middle of each segment. Further on, the white line divides the segment into two unequal brown bands. In the posterior part, the pigment is reduced to two or three transverse, narrow, patches.

*Occurrence* Andaman Islands

*Distribution* Sulu Archipelago, Andaman Islands, Damos Island in the Amirante Islands

#### 189 *Perinereis singaporiensis* Grube (Fig 105, a-d)

*Perinereis singaporiensis*, Grube, 1878, p. 84. Horst, 1924, p. 169, pl. XXXIV, figs 1-2. Pruvot, 1930, p. 55, pl. III, figs 62-64. Fauvel, 1932, p. 103. Monro, 1931, p. 36, figs 1-2.

Proboscis: group I=1-3, II=a rhomboidal cluster of 8-9, III=a transverse tristichous group, IV=crescentic groups, V=0, VI=on each side 2 transversely elongated paragnaths (with one or two conical ones between them?), VII-VIII=two or three rows. Terminal piece of the falcigerous bristles rather long, little curved and ciliated. Posterior feet not increased but dorsal ligules stout and protruding above the ventral ramus.

*Length* 80 mm by 3 mm.

*Colour* A dark median stripe on anterior segments. Black pedal gland conspicuous.

*Occurrence* Singapore, Mergui

*Distribution* New Caledonia, Malay Archipelago, Singapore, Mergui Archipelago, Jack and Una Islands, Burma, Diamond Island

#### 190 *Perinereis vancaurica* (Ehlers). (Fig 105, f-g)

*Nereis vancaurica*, Ehlers, 1864, p. 503, pl. XX. Fauvel, 1923, p. 34 (Synonymy), 1932, p. 103.

*Nereis languida*, Grube, 1867, p. 13, pl. II, fig. 1.

*Perinereis hoisti*, Gravier, 1901, p. 182, pl. XI, fig. 47.

*Perinereis nankaurica*, Augener, 1922a, p. 23.

Proboscis group I=1, 2, II=crescentic clusters, III=a square cluster, IV=triangular clusters, V=3, set in a triangular patch, VI=on each side, two transverse elongated paragnaths, VII-VIII=3 rows. There is sometimes an accessory denticle in group V. Tentacular cirri reaching backwards to the 4-5th setigerous segment. Terminal pieces of falcigerous bristles straight and ciliated. Posterior feet not enlarged.

Fig 105—*Perinereis singaporiensis* Grube, a, posterior foot  $\times 32$ , b, c, proboscis, dorsal and ventral view, d, ventral falciger  $\times 240$  (after Pruvot) *P. sulwana* Horst e, foot  $\times 40$  (after Horst) *P. vancaurica* (Ehlers) f, g, head and proboscis (after Monro)

*Length* 80 mm by 3 mm

*Colour* A dark median stripe on anterior segments.

*Occurrence* Singapore, Mergui

*Distribution* Philippine Islands, Indo-China, New Zealand, Nankauri, Nicobar Islands, Red Sea, Atlantic Ocean, French Guiana

191 *Perinereis cultrifera* Grube (Fig 106, a-l)

*Perinereis cultrifera*, Fauvel, 1923a, p 352, fig 137 (Synonymy), 1932, p 104

*Perinereis floridana* Ehlers, Gravier, 1901, p 185, pl XI, fig 48

*Perinereis perspicillata*, Grube, 1878, p 90, pl IV, fig 10

*Perinereis striolata*, Pruvot, 1930, p 60

*Perinereis helleri*, Grube, 1878, p 81 Pruvot, 1930, p 62

*Perinereis camiguana*, Grube, 1878, p 87

*Perinereis obfuscata*, Grube, 1878, p 86 Horst, 1924, 173, pl XXXIV, figs 5, 6.

Proboscis group I=1, or a few in a line or a small cluster, II and IV=clusters, III=a rectangular cluster, V=I or a triangular patch of 3, VI=on each side, a single broad, flattened paragnath, VII-VIII=2-3 rows Tentacular cirri of variable length Falcigerous setae with short sickle-shaped terminal pieces Posterior feet not modified

Fig 106—*Perinereis cultrifera* Grube a, natural size, b, c, head and proboscis, dorsal and ventral view, d, e, f, anterior, mid-body and posterior feet  $\times 15$ , g, heterogomph falciger  $\times 270$ , h, female, *Heteronereis* stage, i, male *Heteronereis* stage, l, its pygidium, l, male epitocous foot  $\times 20$

*Length* 10–250 mm

*Colour* Dark or yellowish green

This species is liable to extensive variation, especially as regards the armature of the proboscis, the length of the cirri and the shape of the dorsal ligule

The principal varieties, or sub-species, are tabulated as follows

*Key to the varieties of P cultrifera Grube*

- |  |                                   |
|--|-----------------------------------|
| 1 Group V, a triangle of 3 paragnaths    | 2                                 |
| Group V, a single paragnath              | 4                                 |
| 2 Group I, 1 to 3 in a longitudinal line | 3                                 |
| Group I, a small cluster of 4–8          | <i>perspicillata</i> Grube, p 208 |

- 3 Tentacular cirri reaching backwards to the 5—6th setigerous segment *cultrifera* var *typica* Grube, p 208
- Tentacular cirri reaching backwards to the 7—8th setigerous segment *helleri* Grube, p 208
- 4 Group I, 1 or 2 in a line *floridana* Ehlers, p 208
- Group I, a small cluster of 4—5 5
- 5 Tentacular cirri reaching backwards to the 3rd setigerous segment *obfuscata* Grube
- Tentacular cirri reaching backwards to the 9th setigerous segment *striolata* Grube, p 209

var *typica* Grube

Group I=1—3 in a line, V=a triangular patch of three. Tentacular cirri reaching to the 5—6th segment

*Occurrence.* Burma, Diamond Island, Nicobar Islands, Camorta I, Andaman Islands, Cape Comorin

*Distribution:* Cosmopolitan, Pacific, Indian and Atlantic Oceans

var *floridana* Ehlers

Group I=1—2 in a line; V=a single large paragnath

*Occurrence:* Singapore, Cape Comorin.

*Distribution* Gulf of Siam, Malay Archipelago, India, Atlantic Ocean.

var *perspicillata* Grube.

Group I=a small cluster of 4—8 paragnaths, V=triangle of three.

*Occurrence* Indo-China, Singapore, Mormugao Bay

*Distribution* Philippine Islands, New Caledonia, Singapore, India, Persian Gulf, coasts of France

var. *helleri* Grube.

*Perimereis camiguana*, Grube, 1878, p 87 Augener, 1922, p 23

Group I=2, one behind the other, V=a triangular group of 3 large paragnaths. Tentacular cirri reaching backwards to the 8—9th segment

*Occurrence.* Mergui Archipelago, Gulf of Mannar, Bombay Harbour.

*Distribution.* Pacific Ocean, Philippine Islands, India, Atlantic Ocean.

var *striolata* Grube

Group I=a small cluster of 4-5, group, V=a single large paragnath Tentacular cirri reaching backwards to the 9th setigerous segment

*Occurrence* Gulf of Siam, Singapore

*Distribution* Philippine Islands, Indo-China

*Remarks* *Perinereis obfusca* differs from *P striolata* in having shorter tentacular cirri

192 *Perinereis aibuhitensis* Grube (Fig 107, a).

*Perinereis aibuhitensis*, Grube, 1878, p 89, pl V, fig 3 Horst, 1924, p 168, pl XXXIII, figs 4-6 Fauvel, 1932, p 106

Group I=2 in a line, II and IV=clusters; III=a transverse cluster of 3 rows and, on each side, 3-4 in a longitudinal line, V=3, arranged in a triangle; VI=on each side, two stout obtusely conical, hardly flattened

Fig 107—*Perinereis aibuhitensis* Grube a, head and proboscis (after Grube) *P nigropunctata* Horst (= *S. major* Southern) b, c, head and proboscis, dorsal and ventral view  $\times 10$ , d, falciger  $\times 500$ , e, 10th foot  $\times 50$ , f, 70th foot  $\times 50$  (after Southern)

paragnaths, VII—VIII=3 rows Falcigerous bristles with long, straight terminal piece Dorsal ligule of the posterior feet short and thick

*Occurrence* Andaman Islands, Vizagapatam, Mormugao Bay

*Distribution* Philippine Islands, Batavia; Macassar, China, India

193 *Perinereis nigro-punctata* Horst (Fig. 107, b—f)

*Perinereis nigro-punctata*, Horst, 1924, p 171 Fauvel, 1932, p 107

*Perinereis marjori*, Southern, 1921, p 595, pl XXIII, fig 10

*Perinereis yorkensis*, Augener, 1922a, p 24, fig 6, a—e

Proboscis group I=a cluster of 5—12 paragnaths, II and IV=triangular and crescentic clusters, III=a transverse group, V=2 large denticles arranged in a triangle, VI=on each side, a single, large, semi-circular tooth, VII—VIII a double row Falcigerous bristles with short sickle-shaped terminal piece Dorsal ligule greatly enlarged in the posterior feet.

*Length* 50—60 mm by 2—3 mm.

*Colour* Pale purplish brown A V-shaped band behind the eyes Three transverse black spots on the back of the anterior segments.

*Occurrence* Nicobar Islands, Nankauri, Andaman Islands, Chilka Lake, Cape Comorin.

*Distribution* Malay Archipelago, Nicobar Islands, Nankauri, India

194. *Perinereis cavifrons* Ehlers (Fig. 108, a—b)

*Nereis (Perinereis) cavifrons*, Ehlers, 1920, p 47, pl I, fig 6—10

Proboscis group I=2—3, one behind the other, II and IV=crescentic clusters, III=a cluster, V=0, VI=on each side, a rather narrow transverse paragnath, VII—VIII=2 or 3 irregular rows Tentacular cirri reaching backwards to the 6th segment Dorsal cirri about the length of the dorsal ligule Posterior feet not modified Falcigerous bristles with short terminal piece

*Occurrence* Gangetic delta, coast of Travancore, Mormugao Bay

*Distribution* Java, Burma, India

- 195 *Perinereis neocaledonica* Puvot (Fig 108, c—g).  
*Perinereis neocaledonica*, Puvot, 1930, p 50, pl III, figs 77—79  
 Fauvel, 1932, p 107

Body of large size, about 300 segments. Prostomium broader than long, notched between the tentacles. Palps short, globular. Proboscis groups I and II *are missing*; III—IV=a dense cluster of very numerous and very minute denticles, the three groups nearly coalescent, V=1, 2 or 3 large paragnaths, VI=on each side, a transverse row of about 20 conical or slightly flattened paragnaths, VII—VIII=a belt of numerous very small denticles reaching to the groups VI. A similar patch of small denticles,

Fig 108—*Perinereis cavifrons* Ehlers a, anterior part  $\times 4$ , b, 10th foot  $\times 18$  (after Ehlers) *P. neocaledonica* Puvot c, d, proboscis, dorsal and ventral view, e, 16th foot  $\times 30$ , f, hinder foot  $\times 30$ , g, heterogomph falciger  $\times 175$  (after Puvot)

sometimes continuous with the former, lies behind the large paragnaths of group V. Jaws large, dark and smooth. Tentacular cirri very short. Dorsal cirri short. In the anterior feet, dorsal ramus with two ligules. Dorsal ligule of the posterior feet much enlarged, flag-like, with a small dorsal cirrus inserted near the tip. Heterogomph falcigerous bristles with a large shaft and a small terminal piece, easily deciduous.

*Length.* 175–220 mm by 6 mm, setae included

*Colour* Yellowish, in spirit, with traces of a longitudinal chestnut streak

*Occurrence* North Andaman Islands, under stones, Arabian Sea

*Distribution* New-Caledonia, New-Hebrides, Andaman Islands, Arabian Sea

196 *Perinereis nuntia* (Savigny) (Fig 109, a–g)

*Perinereis nuntia*, Fauvel, 1919, p 410 (Synonymy), 1932, p 108

*Proboscis* Group I=0, or 1 to 3 behind one another, II=clusters, III=rectangular patch, IV=triangular clusters, V=0, 1, 2 or 3 set in a triangle, VI=on each side, a single curved row of 5–18 conical, or flattened, or conical and flattened mixed together, VII–VIII=3 rows of large spikes, more or less flattened and, sometimes, 2–3 rows of smaller ones. *Tentacular cirri* reaching backwards to the 3rd–16th setigerous segment. *Dorsal cirri* of variable length. *Parapodia* with dorsal ligules blunt, conical, or tapering. In the posterior feet, the dorsal ligule is enlarged.

This wide-spread species, fairly common in warm seas all over the world, is also liable to extensive variations, and has been described under many names

These varieties may be tabulated as follows:

*Key to the varieties of P nuntia Savigny.*

- |  |                                       |
|--|---------------------------------------|

*Perinereis nuntia* var *vallata*, Fauvel, 1919, p 418 (Synonymy),  
 1932, p 110 Augener, 1913, p 175

Proboscis group I=1-3, II-III-IV=clusters, V=I, set far back, VI=on each side a transverse row of 8-15 paragnaths, conical, flattened, or both mixed together, VII-VIII=3 alternate rows of spikes somewhat flattened Tentacular cirri reaching to the 3rd-6th segment. Dorsal cirri short, dorsal ligules blunt

Length 50-80 mm.

Occurrence Bombay, under rocks, in sand

Distribution Chile, New-Zealand, Australia, Philippine Islands, India, Red Sea, Madagascar, Cape of Good Hope.

## Genus PSEUDONEREIS Kinberg

Paragnaths of the proboscis of three kinds conical, pectinate and transverse. Posterior feet enlarged.

*Mastigonereis longicirra*, Schmarda, 1861, p 109, pl XXXI, fig 250.

Proboscis group I=1-2, II-III=dense rows of small pectinate paragnaths, IV=rows of pectinate denticles and a few conical paragnaths in front, V=1, VI=, on each side, a single large, triangular or flattened paragnath, VII-VIII=two rows of laterally or longitudinally flattened spikes alternating. Tentacular cirri reaching backwards to the 3rd-8th segment. Falcigerous setae without sickle-shaped terminal piece. Homogomph dorsal falcigerous bristles absent. Dorsal ligule of the posterior feet enlarged.

Fig 110—*Pseudonereis gallapagensis* Kinberg a, b, head and proboscis, ventral and dorsal view, c, falciger (after Gravier) *Ps anomala* Gravier e, proboscis, dorsal view, f, posterior foot  $\times 44$ , g, dorsal homogomph falciger  $\times 300$  *Ps rotnnestiana* Augener h, posterior foot  $\times 44$ , i, ventral falciger  $\times 300$

*Length* 20-65 mm by 3-5 mm

*Colour*. In life bluish-grey, in spirit, dark-brown with blue iridescence

*Occurrence* Andaman Islands, Diamond Island, Mormugao Bay

*Distribution* Pacific Ocean, Gallapagos, Peru, Chile, Magellan, Indo-China, Indian Ocean, India, Madagascar, Cape of Good Hope, Atlantic Ocean, Cameroon, San-Thome, Brazil

198 *Pseudonereis anomala* Gravier (Fig 110, e-g)

*Pseudonereis anomala*, Gravier, 1901, p 191, pl XII, fig 50-52  
Fauvel, 1911, p 395, 1932, p 112 Gravelly, 1927, p 15, pl X, fig 25

Proboscis group I=1-3, II-III-IV=several rows of small pectinate paragnaths; V=0, VI=, on each side a transverse row of 6-10 conical paragnaths, VII-VIII=a single row of large paragnaths, more or less flattened Tentacular cirri long Posterior dorsal ligules elongated, with dorsal cirrus near the tip Posterior dorsal falcigerous bristles, with rather short, faintly curved, terminal piece

*Length* 20-65 mm

*Occurrence* Andaman Islands, Gulf of Mannar, Cape Comorin, Kilakarai, Mormugao Bay

*Distribution* Australia, Malay Archipelago, Indo-China, India, Arabian Sea, Persian Gulf, Red Sea, Madagascar

199 *Pseudonereis rotnestiana* Augener. (Fig 110, h, i)

*Pseudonereis rotnestiana*, Augener, 1913, p 184, fig 20, a-c, pl III, fig 46 Fauvel, 1932, p 112

Proboscis group I=0, 1 or 2, II-III=4-5 rows of pectinate denticles, IV=4-5 rows of pectinate denticles and a few conical paragnaths in front, V=0, VI=on each side, a transverse row of 6-10 conical paragnaths, VII-VIII=two alternating rows Tentacular cirri reaching backwards to the 6th-9th setigerous segment. Dorsal ligule of the posterior feet enlarged, with dorsal cirrus near the tip Falcigerous bristles with short, sickle-shaped, terminal piece Homogomph dorsal falcigerous bristles absent

*Length* 25-35 mm by 2-3 mm

*Colour* Head dark coloured, body pale yellow-ochre

*Occurrence* Andaman Islands

*Distribution*: South Australia, Andaman Islands

### Genus PLATYNEREIS Kinberg

Horny paragnaths arranged in pectinate rows of minute denticles All dorsal groups on the maxillary

ring, and at least the mid-dorsals (sometimes all, both dorsal and ventral) on the oral ring generally missing

*Key to the species of Platynereis*

- 1 Dorsal cirrus of the 7th setigerous segment much longer than the others *abnormis* (Horst), p 222
  - Dorsal cirrus of the 7th setigerous segment normal 2
  - 2 *Heteronereis* stage with oar-shaped setae all compound and not conspicuously pectinate 3
  - Heteronereis* stage with pectinate oar-shaped setae, and single setae in the last segments 4
  - 3 Group II absent *dumerilii* (Aud & M-Edwards), p 218
  - Group II present *fusco-rubida* Grube, p 219
  - 4 Oar-shaped setae boldly pectinate *polyscalma* Chamberlin, p 221
  - Oar-shaped setae faintly pectinate Stout hooks in the anterior and posterior feet *pulchella* Gravier, p 220
  - 200 *Platynereis dumerilii* (Aud. & M-Edwards) (Fig 111, a-f)
- Platynereis dumerilii*, Fauvel, 1923a, p 359, fig 141, 1932, p 113  
*Platynereis insolita*, Gravier, 1901, p 197, pl XII, fig 53 Gravelly, 1927, p 16, pl X, fig 23  
*Platynereis bengalensis* Kinberg, Willey, 1905, p 273, pl IV, fig 92-94

Proboscis paragnaths very minute, often pale and little conspicuous Group I=0, III=0, III=a small transverse cluster in two rows, IV=several transverse pectinate rows, V=0, VI=on each side, 1-2 concentric curved rows, VII-VIII=5-7 clusters of small pale denticles (very variable) Tentacular cirri long, extending to the 10th-15th setigerous segment Posterior feet not enlarged Falcigerous bristles with short, hooked, sickle-shaped terminal pieces Dorsal homomorph falcigerous setae with more elongated terminal piece in the posterior feet

*Length* 20-60 mm

*Colour*: In life very variable, greenish, yellowish, pink, reddish, with violet chromatophores and dark pedal glands

*Occurrence* Andaman Islands, Nicobar Islands, Nankai, Gulf of Mannar, Madras Coast, Pamban, Ceylon.

*Distribution* Cosmopolitan, Pacific, Indian and Atlantic Ocean

201 *Platynereis fusco-rubida* Grube

*Nereis (Platynereis) fusco-rubida*, Grube, 1878, p 70 Fauvel, 1911, p 403

Fig 111—*Platynereis dumerili* Aud & M-Edw a, b, head and proboscis, c, foot from mid-body  $\times 30$ , d, posterior foot  $\times 30$ , e, dorsal homogomph falciger  $\times 350$ , f, ventral heterogomph falciger  $\times 350$  *Pl coccinea* Delle Chiave g-n, (not yet found in the Indian area)

In the atocous condition this species is very close to *Pl dumerili*. The chief differences lie in the armature of the proboscis. There is a small row of paragnaths in the groups II, which are missing in *Pl dumerili*, and in groups VI a rectangular cluster, instead of the usual two rows. Such slight differences are hardly of specific value but, on the other hand, the proboscis agrees tolerably well with that of *Pl polyscalma*, whose atocous condition is still unknown. *Pl fusco-rubida* might, perhaps, be this atocous condition, as *Pl pulchella* is the atocous condition of a *Heteronereis* quite distinct from *Pl dumerili*.

*Length* 20–50 mm

*Colour*. Dark pedal glands

*Occurrence* Persian Gulf

*Distribution* Philippine Islands, Persian Gulf

202. *Platynereis pulchella* Gravier (Fig 112, f-h).

*Platynereis pulchella*, Gravier, 1901, p 202, figs 55-56, pl XII, figs 210-212, Monro, 1936, p. 380, fig 1-3, 1937, p 279, fig 10 Fauvel, 1939, p 329

*Platynereis dumerili* var *pulchella*, Fauvel, 1911, p 402, figs 30-32

In the atocous condition this species is so close to *Pl. dumerili* that I considered it as a simple variety characterised by a single row of paragnaths in the groups VI, instead of two, and by slightly different falcigers. In all but a few anterior segments, there are one or four dorsal

Fig 112. *Platynereis polyscalma* Chamberlin a, b, *Heteronereis* stage, anterior part, dorsal and ventral view (after Horst), c, simple bristle from the last segment  $\times 270$ , d, simple ribbed bristle from terminal segments  $\times 270$ , e, swimming bristle  $\times 270$  *Pl pulchella* Gravier f, ventral view of the proboscis, g, simple ribbed bristle (after Monro), h, dorsal homogomph falciger from anterior foot  $\times 380$  *Pl abnormis* (Horst) i, 7th foot of the female  $\times 50$ , k, 7th foot of the male  $\times 50$  (after Horst)

homogomph falcigers, the terminal piece with downward curved, smooth tip and conspicuous terminal ligament having its basal attachment as far down as the tip of the articular cup

But the epitocous condition is quite different from *Pl. dumerili* and close to that of *Pl. polyscalma*, differing only in the presence of the said dorsal homogomph falcigers in the last segments of the anterior part and in the blades of the swimming bristles whose fringes are very fine and difficult to see, and, last, the terminal, simple, ribbed bristles are finer

*Length* 15–30 mm *Heteronereis* stage, about 15 mm, male with two regions

*Occurrence* Andaman Islands, Nicobar Islands, Nankauri

*Distribution* Indo-China, Bay of Bengal, Arabian Sea, Persian Gulf, Red Sea.

203. *Platynereis polyscalma* Chamberlin (Fig 112, a–e)

*Platynereis polyscalma*, Chamberlin, 1919, p 219, pl XXX, XXXI Horst, 1924, p 186, Fauvel 1931, p 23, pl III, figs 1–6, 1932, p 114, 1935, p 323, 1939, p 329 Gravier and Dantan, 1934, p 121, figs 123–124 Monroe, 1935, p 125  
(?) *Platynereis integer*, Treadwell, 1920, p 595, fig 4

Atocous condition still unknown *Heteronereis* stage Prostomium snout-like, protruding, broadly rounded in front Tentacles small, ventral, pointing backwards; the palps have a similar disposition, but concealed under the head and lowered over the mouth Four enormous eyes with lenses, the anterior pair much larger than the posterior and nearly ventral in position Proboscis group I=0, II=chitinous areas destitute of paragnaths, III=pectinate cluster, IV=crescentic clusters of small pectinate denticles, V=0 (or 1?), VI=on each side a round or oval cluster of pectinate paragnaths, VII–VIII a row of several oval clusters Tentacular cirri reaching backwards to the 6th–9th segment Anterior dorsal cirri of the male swollen, the succeeding ones crenulated Two large anal cirri with a filiform tip and a rosette of papillae Swimming bristles compound, with long oval blades, bearing, on one side, below the apex, very long and spine-like delicate marginal teeth projecting at an angle In the last segments simple setae with a ribbed blade

In the male specimens, the epitocous transformations commence on the 15th setigerous segment. The inferior

ventral ligule has three processes and the dorsal lamella of the ventral cirrus is bifurcated. The last 15–16 segments resemble a kind of narrow, slender, tail but the appearance is rather delusive as all these segments are provided with epitocous bristles and lamellae, only the ventral division is much smaller. The anus is surrounded by a rosette of minute hollow papillae and the pygidium bears two anal filiform cirri.

As already stated, it might be, perhaps, the epitocous condition of *Pl. fusco-rubida*.

*Length* 10–20 mm.

*Occurrence* Nicobar Islands, Nankauri Harbour, Andaman Islands, in plankton.

*Distribution* Funafuti, Gilbert Islands (Philippine Islands?), Java, Weiu Island, Indo-China, Gulf of Siam, Nicobar Islands, Andaman Islands.

#### 204 *Platynereis abnormis* (Horst) (Fig 112, i–k).

*Nereis abnormis*, Horst, 1924, p. 163, pl. XXXII, fig. 6. Augener, 1926b, p. 448. Fauvel, 1930, p. 23.

*Platynereis abnormis*, Fauvel, 1932, p. 113.

*Proboscis*.—Group I=0, II=a small concave row of paragnaths; III=0, IV=a crescentic row of paragnaths, V=0, VI=a triangular row of paragnaths, VII–VIII=five small, transverse groups of paragnaths, three of them in the median part and one on each side. Tentacular cirri long. *A very long dorsal cirrus on the 7th setigerous segment*. Falcigerous setae with sickle-shaped terminal pieces bent in the form of a hook with a dorsal prominence. Posterior dorsal homogomph falcigerous bristles.

The atocous specimens resemble *Pl. dumerilii* except in the characteristic, very long, dorsal cirrus of the 7th setigerous segment. The falcigers are also alike. The mutation of the feet occurs about the 14th to 15th feet in the male and 16th in the female, according to Augener. In *Heteronereis* stages from Trincomali he noticed three regions, an anterior of 14 segments, with a long cirrus on the seventh, a middle one of 43, and a posterior, atocous, of 11 segments. Moreover, he mentions two other long filiform cirri on the eighth segment of the posterior region.

*Length* male *Heteronereis*, 10 mm.

*Occurrence* Trincomali; Krusadai, Pamban; from weeds.

*Distribution*: Malaya Archipelago, Ceylon.

*Incertae Sedis—*

- 205 *Nereis* (s. str.) sp. m. ezoensis Izuka, Gravelly, 1927, p. 13, pl. X, fig. 22

Does not agree with Izuka's species, and description insufficient for identification

- 206 *Nereis ehlersiana* Grube, Willey, 1905, p. 272

A male *Heteronereis* stage, which cannot be identified (Ceylon).

- 207 *Nereis festiva* Grube, 1874, p. 326

A *Platynereis* spec. from Ceylon

- 208 *Nereis foliosa* Schmarda, 1861, p. 104, pl. XXXI fig. 243

Very likely an *Eunereis* spec. from Ceylon

209. *Nereis* spec., Fauvel, 1932, p. 116

A small *Heteronereis*, perhaps related to *N. jacksoni* Kinberg or *kauderni* Fauvel, from Pamban

## Family NEPHTHYDIDAE Grube

Body elongate, subtetragonal in cross section. Segments short and numerous. Prostomium small, flattened, polygonal. Four small tentacles. Proboscis with terminal bifid papillae and longitudinal rows of soft papillae. Two horny jaws inside the pharynx. First foot rudimentary. Parapodia biramous, both divisions wide apart, provided with membranous lobes and simple setae, a branchia coiled between the rami. a single anal cirrus.

## Genus NEPHTHYS Cuvier

The characters of this genus are those of the family.

*Key to the species of Nephthys*

*N dibranchis* Grube e, foot  $\times 40$

cirrus Setae long, slender, and also bifurcate, lyriform, bristles

*Length.* 20–30 mm by 2 mm.

*Colour.* Whitish or pink

*Occurrence* Orissa Coast, Vizagapatam, Madras, Maldiva and Laccadive Islands, Gulf of Oman, Persian Gulf

*Distribution* New Zealand, New Guinea; Australia, Arafura Sea, India, Laccadive Sea, Arabian Sea, Gulf of Oman, Persian Gulf, South America.

212. *Nephtys gravieri* Augener (Fig 114, a–c)

*Nephtys gravieri*, Augener, 1913, p 123, fig 6. pl II, fig 5, 1927a, p 116 Fauvel, 1932, p 118

Setigerous lobes conical, blunt, anterior lamellae missing or much reduced, dorsal posterior lamella oval, ventral larger and more rounded Branchiae broad, short, oval, with a small dorsal cirrus and a bent process at its base Anterior bristles barred and short, posterior ones very long, boldly serrated on the concave border

*Length* 25–30 mm

*Colour* Yellowish or pink.

*Occurrence* Off Puri, Orissa, Bay of Bengal, 847 fms

*Distribution:* South Australia, Bay of Bengal.

213. *Nephtys malmgreni* Theel (Fig 114, b, d) .

(?) *Nephtys malmgreni* Theel, Fauvel, 1923a, p 371, fig 145

The ventral cirrus of the first foot is longer than the posterior tentacles, the dorsal one is very small Dorsal and ventral setigerous lobes sharp and conical, the dorsal and ventral anterior lamellae are mere rounded folds, shorter than the foot, the posterior lamellae are only a little larger The gills are long, cylindrical, coiled inwards, or straight, with a short conical dorsal cirrus The anterior setae are barred, the posterior ones nearly smooth

*Remarks:* These Indian specimens differ slightly from the *N malmgreni* from Europe, for the dorsal posterior lamella does not appear to be bilobed.

*Length* 70–80 mm

*Colour* Yellowish-white, in spirits

*Occurrence* Andaman Sea, 279 fms. Off Akyab, Burma, 250 fms.

*Distribution* Indian Ocean, Andaman Sea, Bay of Bengal, Atlantic Ocean, North Sea, Mediterranean Sea

214. *Nephtys polybranchia* Southern (Fig 115, a—c)

*Nephtys polybranchia*, Southern, 1921, p 607, pl XXIV, fig 11  
Fauvel, 1932, p 118

Prostomium with four tentacles on the anterior border, two small eyes. Ventral cirrus of the first foot very small, the dorsal is quite rudimentary. Setigerous lobes bluntly conical. Dorsal lamellae shorter than the setigerous lobe, ventral lamellae a little longer, both rami

Fig 115—*Nephtys polybranchia* Southern a, anterior end  $\times 46$  (after Southern), b, 13th foot  $\times 50$ , c, hind foot  $\times 50$  *N. oligo-branchia* Southern d, anterior end and proboscis  $\times 30$  (after Southern), e, 14th foot  $\times 50$ , f, hind foot  $\times 50$

widely apart, but not very divergent. A small gill on the second foot, well developed ones from the seventh to the 30th segment, where they become short, broad, foliaceous, with a median ridge, and the dorsal cirrus is reduced to a small knob. They persist to the end of the body. The camerated or barred setae are restricted to the anterior feet and are replaced in the middle and posterior feet by long, slender, capillary setae with slightly flattened blades,

very finely serrated along one edge The condition of the gills appears to be somewhat variable

*Length* About 20 mm A brackish-water form.

*Occurrence* Shanghai, Taleh-Sap, Calcutta Water Works (Pulta), Chilka Lake, Madras

215. *Nephtys oligobranchia* Southern (Fig 115, d--f)

*Nephtys oligobranchia*, Southern, 1921, p 610, pl XXIV, fig 12 Fauvel, 1932, p 119

" Differs from *N polybranchia* in the distribution of the branchiae which occur fully developed on the sixth foot, and disappear on the 20th to the 23rd foot, whereas in *N polybranchia* the branchiae are larger on the fifth foot and persist almost to the end of the body, in that the branchiae contain a double vascular loop whereas there is only a single loop in *N polybranchia*, in that the posterior lamellae of the feet are considerably surpassed by the spiral lobe " (Southern)

*Remarks* As there are also several vascular loops in, at least, the anterior branchiae of *N polybranchia*, differences on that account are not of much value Both may be only varieties of one species Both live in water of variable salinity The number and disposition of the papillae of the proboscis have not the value generally set on them for the identification of *Nephtys* for there is often a wide range of variation

*Length* 10--20 mm

*Occurrence* Calcutta Water Works (Pulta) and Salt Lakes, Chilka Lake, Vizagapatam, Cochin backwater

*Distribution* Taleh-Sap, Kiangsee, Mergui, Bay of Bengal, India

*Incertae Sedis*—

216 *Nephtys dussumieri* Valenciennes, Quatrefages, 1865, p 427. From the coast of Malabar

Family EUNICIDAE Grube

Body elongate, vermiform Prostomium with lobate palps more or less united Tentacles subulate, 1 to 7 or more First two segments generally achaetous and apodous Sometimes one pair of tentacular cirri on the second segment Feet uniramous or sesquiramous Dorsal cirri with or without branchiae, sometimes rudimentary or missing Ventral cirrus sometimes missing Setae

simple, or simple and compound, very varied in shape. Proboscis armed with lower jaw-plates (labium) and a number of biserial toothed upper jaw-plates. Sometimes a membranous tube.

The *Eunicidae* are divided into subfamilies and genera as follows

*Key to the subfamilies and Genera of EUNICIDAE*

- |    |   |  |
|----|---|--|
| 1  | Prostomium without (visible) tentacles and palps. Dorsal cirri rudimentary, no ventral cirri.                                     | Subfamily<br><i>LUMBRICONERINAE</i><br>Grube, 14 |
|    | Prostomium with tentacles   | 2  |

|    | Tentacular cirri present.   | 9  |
| 9  | Branchial filaments inserted spirally.  | <i>Diopatra</i> Aud. & M. -<br>Edwards, p. 251   |
|    | Branchiae cirriform or pectinate.   | 10   |
| 10 | Three anterior feet much enlarged, directed forwards and bearing long capillary bustles.  | <i>Rhamphobrachium</i><br>Ehlers, p. 261         |

- Anterior feet little modified,  
bearing hooked bristles, simple or compound
- 11 Tentacles and palps very large, more or less articulate Dorsal and ventral cirri well developed  
Tentacles and palps rudimentary Dorsal and ventral cirri very short ..
- 12 Three short tentacles Branchiae absent  
Tentacles rudimentary or absent Branchiae present
- 13 Three subulate tentacles folded backwards into a dorsal groove  
Three short rounded tentacles partly hidden under the border of the first segment
- 14 Small parasitic worms 18  
Free, and often very large worms 15
- 15 Cirriform branchiae present Ninoe Kinberg, p 277  
Branchiae absent 16
- 16 Capillary setae and hooks simple or compound Lumbriconereis Blainville (Grube rev), p 263  
Only winged capillary setae 17
17. With a stout acicular bristle Jaws III and IV single hooks Drilonereis Claparède, p 276  
Dorsal acicular bristle absent Jaws III and IV toothed plates Four eyes .
18. Lower jaw well developed, with 2 hooks Parasitic on Syllids Arabella Grube, p 274  
Lower jaw reduced, without hooks Parasitic on Spio and Bonellia Labrorostratus Saint-Joseph  
Oligognathus Spengel

The genera *Iphitime*, *Halla*, *Labrorostratus*, *Oligognathus* and *Ophryotrocha* are not yet recorded from India.

The genus *Nicidion* which differs only from *Eunice* in the absence of gills may be regarded as a subgenus of the latter, if not as simple varieties. Other genera, such as *Paramarphysa*, *Paradiopatra*, *Paraonuphis*, are doubtful and further investigations are still wanted to settle their status.

#### Subfamily EUNICINAE Kinberg.

Two palps One, two or five occipital tentacles Frontal tentacles absent. Anterior feet not modified. Bran-

chiae pectinate or simple, or missing Setae simple, compound and acicular A lower jaw and 3-5 pairs of upper jaws

### Genus EUNICE Cuvier.

*Leodice* Savigny

*Eriphyle* Kinberg

Body very long Head with five tentacles ctenophore not ringed, two bulbous palps A pair of tentacular cirri inserted on the second apodous segment Dorsal cirri elongate; ventral cirri short or knob-like Branchiae simple, or more generally pinnate. Parapodia sesquialmous, with acicular setae, simple pectinate (or comb-like) and compound setae Lower jaw of two pieces Upper jaws with a pair of mandibles and two or three pairs of toothed plates, an unpaired left plate and sometimes paragnaths

### Key to the species of Eunice

- |   |    |                                     |
|---|----|-------------------------------------|
| 1 Gills simple, or with only two filaments, beginning very far from the head            | 2  |                                     |
| Gills branched  | 4  |                                     |
| 2 Comb and acicular setae absent  |    | <i>siciliensis</i> Grube, p 241     |
| Comb and acicular setae present   | 3  |                                     |
| 3 Gills begin about 28th foot   |    | <i>marenzelleri</i> Gravier, p 242  |
| Gills begin about 80th-100th foot   |    | <i>gracilis</i> Crossland, p. 243   |
| 4 Gills bipectinate   |    | <i>investigatoris</i> Fauvel, p 239 |
| Gills pectinate   | 5  |                                     |
| 5 Acicular setae tridentate   | 6  |                                     |
| Acicular setae bidentate  | 8  |                                     |
| 6 Gills well developed in the posterior part of the body ..                             |    | <i>antennata</i> Savigny, p 240     |
| Gills absent in the posterior part of the body  | 7  |                                     |
| 7 Gills begin on 3rd or 5th foot  |    |                                     |

| 9 Compound setae with sword-shaped terminal piece anteriorly, sickle-shaped posteriorly |    | <i>tubifex</i> Crossland, p 232     |
| Compound setae all sickle shaped  |    | <i>floridana</i> Pourtales, p 235   |

- 10 Gills occur only on the anterior third of the body, beginning about 6th to 9th foot *coccinea* Grube, p 236  
 Gills continue nearly to the hind end of the body 11
- 11 Gills begin about 3rd to 8th foot 13  
 Gills begin about 10th to 30th foot and attain to from 4 to 16 filaments anteriorly but are simpler in the posterior region 12
- 12 Gills begin about 10th to 20th foot and attain to from 6 to 16 filaments *afra* Peters, p 235  
 Gills begin about 25th to 30th foot and attain to from 4 to 6 filaments *afra* var *paupera* Grube, p 236
- 13 Very large species Tentacles smooth Gills up to 25-30 and more filaments *aphnoiditis* Pallas, p 233  
 Smaller species Tentacles annulated 14
- 14 Gills begin about 4th to 6th foot and consist of 6-20 filaments *tentaculata* Quatrefages, p 234  
 Gills begin on 3rd or 4th foot and consist of 2 to 4 filaments 15
- 15 Gills suddenly disappear about 80th segment *savignyi* Grube, p 238  
 Gills continue nearly to the last segments *grubei* Gravier, p 237.

217 *Eunice tubifex* Crossland (Fig 116, a-g)

*Eunice tubifex*, Crossland, 1904, p 303, figs 52-55, pl XXI, figs 1-8 Willey, 1905, p 282 Fauvel, 1930, p 26

Prostomium bilobed Tentacles short, smooth Gills begin about 20th-35th foot and attain 3-6 filaments Body with very large, thick, ventral glandular pads for about 50 segments, then rounded and decreasing In the anterior feet, the compound setae have a smooth elongate *knife-like* end-piece In the middle and posterior regions the end-pieces are bidentate, *sickle-shaped* hooks as in other species A membranaceous tube

*Length*: 150-220 mm by 5-10 mm

*Colour*. in spirit, dark mahogany, more or less checkered

*Occurrence* Ceylon, Gulf of Mannar, Krusadar Island

*Distribution* South Australia, Philippine Islands, Indian Ocean, Atlantic Ocean

Fig 116—*Eunice tubifex* Crossland a, 20th foot  $\times 16$ , b, 80th foot  $\times 16$ , c, 120th foot  $\times 16$ , d, hind foot  $\times 16$ , e, falciger, f, knife-ended compound seta from 20th foot, g, anterior part (after Crossland) *E. afra* Peters h, falciger  $\times 245$ , i, head (after Crossland)

218 *Eunice aphroditois* Pallas. (Fig 117, a–g)

*Eunice aphroditois*, Fauvel, 1917, p 215, pl VII (Synonymy), 1930b, p 533, 1932, p 133 Pruvot, 1930, p 65 Monro, 1931, p 44, Augener, 1926, p 455

*Eunice roussaei*, Quatrefages, 1865, p 309, pl X, figs 1–4 Fauvel, 1917, p 220, pl VIII (Synonymy)

*Eunice gigantea*, Quatrefages, 1865, p 311

A very large species Palps bilobed or multi-lobed Tentacles short, blunt, smooth or faintly wrinkled Tentacular cirri short The gills, which begin about the 5th to 10th foot, are generally branched on the 5th–6th foot and attain up to 25, 30, and even 40 filaments Acicular bristles black, blunt, missing in old specimens or irregularly distributed in the posterior region Acicular, black, compound bristles with short sickle-shaped end-piece.

*Length* Up to 1 metre, and more, by 20–25 mm

*Colour* In spirit, a brown chequered pattern, often with a white collar on third and fourth setigerous segments. The colour fades in alcohol. Dark blue in life, parapodial lobes tipped with white, yellowish brown spots (when young)

Fig. 117—*Eunice aphroditois* (Pallas) a, anterior part, reduced, b, 32nd foot  $\times 2$ , c, d, falcigers  $\times 70$ , e, comb-seta  $\times 175$ , f, acicular bristle  $\times 105$ , g, simple bristle  $\times 105$ . *E. floridana* Pourtales, a', anterior part  $\times 1\frac{1}{2}$ , b', 31st foot  $\times 8$ , c', superior jaws, d', labium (lower jaw), e', acicular bristle  $\times 85$ , f', comb seta  $\times 210$ , g', falciger  $\times 105$ .

*Occurrence* Singapore, Andaman Islands, Gangetic Delta, Ceylon, Maldivé Archipelago

*Distribution* Pacific, Indian and Atlantic Oceans, Mediterranean Sea

## 219 *Eunice tentaculata* Quatrefages (Fig 118, m–p)

*Eunice tentaculata*, Quatrefages, 1865, p. 317. Fauvel, 1917, p. 209, fig. XVII (Synonymy), 1930, p. 25, 1932, p. 134.

*Eunice pycnobranchiata*, McIntosh, 1885, p. 294, pl. XXIV, figs 13–15.

*Eunice elseyi*, Baird, 1870b, p. 344.

*Eunice martensi*, Willey, 1905, p. 281, pl. IV, figs 102–104.

Palps more or less bilobed. Tentacles annulated, rather long. Tentacular cirri articulate. Gills begin about 3rd to 6th foot and attain to 6–20 filaments and conti-

nue to the hind part of the body Acicula and acicular setae black

*Length* 200–350 mm. by 10–15 mm

*Colour* Purple-violet in life Brown or spotted in spirit, sometimes a white collar on the fourth setiger

*Occurrence:* Ceylon, Galle, Gulf of Mannar, Laccadive Islands.

*Distribution.* New Zealand, Australia, Malaya Seas, Nicobar Islands; Andaman Islands, India, Laccadive Islands

220 *Eunice floridana* Pountales (Fig 117, *a'–g'*).

*Eunice floridana*, Ehlers, 1887, p 88, pl XXII, fig 17 Fauvel, 1923, p 402, 1914b, p 149, pl I, figs 5, 8, 11, 1912, p 134

*Eunice gunneri*, Roule, 1907, p 33, pl II, fig 11

*Eunice amphiheliae*, Roule, 1896, p 446

*Eunice philocorallia*, Buchanan, 1893, p 173, pl IX, figs 2–6, pl X, figs 7–9, pl XI

Palps bilobed Tentacles articulate or moniliform, the median twice as long as the laterals Tentacular cirri smooth Gills begin about 7th to 10th foot and attain to 8–10 filaments, and continue nearly to the last segments Acicula and acicular setae black Commensal with corals A membranaceous tube

*Length* 100–200 mm

*Colour:* Black, pink, or brown, with mahogany spots Sometimes a pale collar on the fourth setigerous segment

*Occurrence* Laccadive Sea.

*Distribution* Indian and Atlantic Oceans, Mediterranean Sea

221 *Eunice afra* Peters. (Fig 116, *h–i*)

*Eunice afra*, Crossland, 1904, p 289, pl XX, fig 15 Willey, 1905, p 279 Augener, 1926, p 456 Fauvel, 1930b, p 25, 1932, p 135 Pruvot, 1930, p 69

Tentacles smooth or faintly annulate Gills begin about 13th to 20th foot and attain to 4–16 filaments, and continue to the hind part of the body Acicula and acicular setae dark Body nearly cylindrical anteriorly, broad and flattened posteriorly

*Length:* 150–250 mm

*Colour* Dark coloured, more or less spotted with white dots, sometimes a clear collar on the fourth setigerous segment

*Occurrence* Meigui, Gulf of Mannar, Ceylon.

*Distribution* Pacific Ocean, Philippine Islands, Malaya Seas, Indian Ocean, Zanzibar, Madagascar, Red Sea

var *paupera* Grube

*Eunice paupera*, Grube, 1878, p. 160 Pruvot, 1930, p. 69, Fauvel, 1930b, p. 537 1932, p. 135

Palps slightly bilobed, tentacles smooth or faintly wrinkled, the median reaches backwards to the fourth setigerous segment Tentacular cirri smooth, subulate, somewhat shorter than the buccal segment Gills begin about 23rd–27th foot First 2, 3 or 9 gills are simple, succeeding ones are bifid or trifid and the following ones decrease to two, or even one, filament Gills are missing on the last tenth of the body, or more Acicula and acicular setae black The section of the body is semi-cylindrical, and flattened in the hind part

*Remarks* This is a variety of *E. afra*, differing only in its simpler gills (reduced to 3–4 filaments) beginning farther from the head There is a whole range of intermediate forms

*Length* 200–250 mm

*Colour* Colourless in spirit.

*Occurrence.* India

*Distribution* New Caledonia, Philippine Islands, Malay Seas, Red Sea

222. *Eunice coccinea* Grube (Fig. 118, a–e)

*Eunice coccinea*, Grube, 1878, p. 153, pl. IX, fig. 1 Crossland, 1904, p. 297, pl. XX, figs. 6–7 Willey, 1905, p. 280; Ehlers, 1908, p. 85 Fauvel, 1919, p. 375, fig. 5, 1932, p. 136

Tentacles smooth. Gills begin about 6th, 9th, to 13th foot, they attain to 6–20 filaments and occur only on the anterior third of the body, which is highly arched dorsally throughout its length Acicular setae bidentate or blunt Hind body rounded

*Length* 100–130 mm

*Colour* red or red violet, in spirit, with small white dots A pale collar on the fourth setigerous segment

*Remarks* Differs chiefly from *E. afra* by the posterior part of the body being rounded instead of flattened, and gills more numerous and with more filaments

*Occurrence* Ceylon, Maldive Archipelago

*Distribution* Philippine Islands, Malayas Seas, Indian Ocean, Red Sea, Atlantic Ocean, Gulf of Guinea

Fig 118—*Eunice coccinea* Grube a, b, c, more or less worn out falcigers  $\times 245$ , d, comb-seta  $\times 230$ , e, acicular bristle  $\times 230$  *E. antennata* Savigny, f, hind foot's falciger  $\times 230$ , g, acicular bristle  $\times 105$  *E. australis* Quatrefages h, i, acicular bristles  $\times 105$ , k, falciger  $\times 105$ , l, comb-seta  $\times 105$  *E. tentaculata* Quatrefages m, n, falcigers  $\times 105$ , o, acicular bristle  $\times 105$ , p, comb-seta  $\times 230$

### 223 *Eunice grubei* Gravier. (Fig 119, a–e)

*Eunice grubei*, Gravier, 1900, p 258, pl XIV, figs 87–88 Crossland, 1904, p 288 Pruvot, 1930, p 68 (Synonymy) Fauvel, 1932, p 136, 1939, p 334

(?) *Eunice micropion*, Marenzeller, 1879, p 135, pl V, fig 1  
Monro, 1924, p 55

Tentacles articulate Gills begin on 3rd–4th foot, they attain to 4–10 filaments and continue nearly to the last segments Acicula dark or yellow Acicular setae bidentate

*Length* 150–230 mm. by 7 mm

*Colour* In spirit, uniformly dark grey-brown, iridescent

*Occurrence* Singapore, Camorta Island, Nicobars, Off Akyab, Burma

*Distribution* Japan (?), New Caledonia, Amboma, Indo-China, Philippine Islands, Malayas Seas, Nicobar Islands, Maldive Archipelago, Red Sea, East Africa.

224 *Eunice savignyi* Grube. (Fig 119, *h-k*)

*Eunice savignyi*, Grube, 1878, p 150 Ehlers, 1908, p 88, pl IX, figs 7-13 Fauvel, 1932, p 136

Tentacles articulate. Gills begin on 3rd or 4th foot, they attain to 8-15 filaments, but further back become reduced to one and finally disappear altogether about

Fig 119.—*Eunice grubei* Gravier *a*, comb setae, *b*, falciger, *c*, acicular bristle, *d*, anterior foot, *e*, 37th foot (after Gravier) *E. marenzelleri* Gravier *f*, foot *E. indica* Kinberg *g*, falciger  $\times 333$  *E. savignyi* Grube *h*, 25th foot  $\times 23$  (after Ehlers) *i*, falciger  $\times 333$ , *k*, acicular bristle  $\times 133$

30th-40th feet Acicular setae yellow, bidentate. The edge of the labrum is prominent, white and toothed.

*Length.* 60-70 mm by 3-4 mm.

*Colour.* Brown-yellow, iridescent

*Occurrence.* Ceylon; Persian Gulf

*Distribution.* Philippine Islands, Ceylon, Persian Gulf, Agulhas Current.

225. *Eunice investigatoris* Fauvel. (Fig 120, a-f)*Eunice investigatoris*, Fauvel, 1932, p 137, fig 19

Body cylindrical anteriorly, semi-cylindrical in the middle and flattened in the hind part. Palps bilobed. The three median tentacles are subequal and reach backwards to the 6th–7th setigerous segment, the two outer tentacles are hardly as long. The tentacles are all subulate, slender and smooth. The buccal segment (peristomium) is thrice as long as the succeeding one. Two tentacular cirri set on a short achaetous segment. Gills from the 6th setigerous segment, the first one small, but already compound, they are very large about the 7th–8th, with 18–20 filaments about the 14th setiger. Well developed

Fig 120—*Eunice investigatoris* Fauvel a, 5th foot  $\times 23$ , b, 10th foot  $\times 23$ , c, fragment of branched gill  $\times 23$ , d, comb-seta  $\times 295$ , e, compound seta  $\times 117$ , f, acicular bristle  $\times 117$

on about forty segments, they decrease in size in the mid-body and increase again very much in the posterior region, where they continue to the 6th–7th small segments preceding the pygidium. The posterior gills are dichotomously branched. In the mid-body there are already a few bifid or trifid filaments. Dorsal cirri long and smooth in the first segments, then shorter than the gills; they are not knife-like, and, except the first ones, hardly thicker than the branchial filaments. Ventral cirri finger-like in the first 5–6 feet, in the succeeding ones short and moniliform, they again become digitiform in the posterior

half of the body, becoming longer and longer toward the hind part, where they are twice as long as the feet. Pygidium with two long, smooth, ventral cirri. Acicula black. Acicular setae black, bidentate, hooded, beginning about the 44th–45th foot. Comb-setae long, narrow, with 8–10 teeth and equal sides, or, sometimes, one longer. Capillary setae long, slender, faintly winged. Terminal pieces of the compound setae strongly bidentate, with a hood not protruding above the tip, the shaft is slightly enlarged. Labrum dark, with anterior edge toothed. A single specimen, 110 mm long and 7 mm broad, colourless or light yellowish-grey in spirit.

*Occurrence* Persian Gulf, 25 fms. "Investigator"

226. *Eunice antennata* Savigny (Fig 118, f–g)

*Eunice antennata*, Crossland, 1904, p 312, pl XXII, figs 1–7, Willey, 1905, p 280. Augener, 1926, p 456. Gravelly, 1927, p 17. Fauvel, 1917, p 225, fig XX, 1932, p 138, 1939, p 334, Pruvot, 1930, p 72.

Tentacles *deeply annulated*. Gills beginning about the 4th–6th foot, continued to near the anus, they attain to 10–15 filaments and are *much more developed in the anterior and posterior regions than in the mid-body*. Acicular setae yellow, *tridentate*.

*Length*. 100–160 mm by 5–8 mm.

*Occurrence*. Singapore, Andaman Islands, Gulf of Mannar, Ceylon, Persian Gulf.

*Distribution*. Pacific Ocean, Philippines, Indo-China, India, Persian Gulf, Red Sea.

227. *Eunice australis* Quatrefages (Fig 118, h–l).

*Eunice australis*, Fauvel, 1917, p 228 (Synonymy), Fig XXI. Augener, 1926, p 437. *Eunice murrayi* McIntosh, Crossland, 1904, p 310. Willey, 1905, p 281.

Tentacles *deeply annulated*. Gills beginning about 6th–7th foot, they attain to 10–15 filaments. They are found *only on the anterior third of the body* and disappear suddenly. Acicular bristles yellow, *tridentate*.

*Length* 60–90 mm by 5 mm.

*Colour*. In spirit, yellowish, with sometimes a white spot on the back of each segment.

*Occurrence* Nankauri, Nicobar Islands, Andaman Islands, Off Cape Negrais, Burma, Ceylon.

*Distribution*. Australia, New-Zealand, India, Maldivé Archipelago, Gulf of Oman, Zanzibar, Cape of Good Hope.

228 *Eunice indica* Kinberg (Fig 119, g).

*Eunice indica*, Crossland, 1904, p 318, pl XXI, figs 9-12  
 Willey, 1905, p 280 Fauvel, 1919, p 378 (Synonymy), 1932  
 p 139 Monro, 1937, p 296

Tentacles smooth Gills begin on 31d foot, they attain to 10-20 filaments and are found only on the anterior third of the body. Acicular setae yellow, numerous (4-5), *tridentate* Terminal piece of the compound setae sometimes tridentate *with a sharp protruding guard* Closely allied to the European *E vittata* D Ch

*Length* 50-70 mm

*Colour* Yellowish, discoloured in spirit.

*Occurrence* Nankauri, Nicobar Islands, Mergui, Bay of Bengal, Ceylon, Maldivé Archipelago, Gulf of Oman

*Distribution* Japan, New Caledonia, Gambier Islands, Indian Ocean, Persian Gulf, Red Sea

229 *Eunice sicilensis* Grube (Fig 121, e-m)

*Eunice sicilensis*, Fauvel, 1923a, p 405, fig 159, e-m, 1917, p 231 (Synonymy), 1932, p 138, Crossland, 1904, p 323, pl XXII, figs 8-9 Willey, 1905, p 282 Augener, 1926, p 457 Gravely, 1927, p 17

*Eunice leucodon*, Ehlers, 1901, p 128, pl XVI, figs 1-10

Body divided into two distinct regions, an anterior narrow and rounded, and a posterior soft and flattened Tentacles short, smooth or faintly annulate *Gills simple*, beginning very far from the head, about 60th, 70th, or 100th foot *Comb-setae and acicular setae absent* Lower jaw (labrum) white, calcareous, gouge-like

*Length* 150-300 mm

*Colour* Anterior part pink or brown, middle body slate-blue or dark green In mature specimens, posterior part long, swollen, soft, with a brownish-red spot in the middle of the ventral part of each segment, as in the Palolo worm In the short uncoloured posterior part, preceding the pygidium, this brown spot fades gradually or disappears altogether in different specimens The sexual region very likely breaks off when mature and is regenerated later, as is the case of the Palolo worm, which is also an inhabitant of corals

*Occurrence* Nankauri, Nicobar Islands, Andaman Islands, Gulf of Mannar, Ceylon, Maldivé Archipelago, Muskat Shore, Gulf of Oman, Persian Gulf

*Distribution* Cosmopolitan, Pacific, Indian and Atlantic Oceans, Mediterranean Sea.

Fig 121—*Eunice sicilensis* Grube e, f, head, dorsal and ventral view, g, upper jaws, h, anterior foot  $\times 15$ , i, one of the first branchiate feet  $\times 15$ , k, foot from mid-body  $\times 15$ , l, hind foot  $\times 15$ , m, falciger  $\times 400$

230 *Eunice marenzelleri* Gravier (Fig 119, f)

*Eunice marenzelleri*, Gravier, 1901, p 229, figs 78–82, pl XIII, figs 68, 69 Fauvel, 1919, p 378

Palps bilobed Tentacles smooth, short and slender Tentacular cirri smooth Gills begin about the 28th foot, they are all simple, very long and persist to the hind part of the body The dorsal cirri decrease from before backwards Acicula and acicular setae brown Simple setae, compound setae, and comb setae present

Length 140 mm by 5 mm

Colour. Uniform red-brown

Remarks The presence of acicular and comb-setae clearly differentiates this species from *E sicilensis* Grube.

*Occurrence* Persian Gulf

*Distribution* Red Sea, Persian Gulf

231 *Eunice* (*Nicidion*) *gracilis* Crossland (Fig 122, a-f)

*Eunice gracilis*, Fauvel, 1930a, p 26, fig 6, 1932, p 140, fig 20  
*Nicidion gracilis*, Crossland, 1904, p 327, figs 65-66, pl XXII,  
 figs 10, 11 Augener, 1913, p 284

Body small, filiform, rounded Tentacles short, smooth or very faintly annulate Gills beginning very far from the head, about 80th-100th foot or even farther back They are simple, or consist of two filaments Comb-setae and acicular setae present Prostomium broad, slightly notched in front Eyes large, reniform.

Fig 122—*Eunice* (*Nicidion*) *gracilis* Crossland a, anterior abran-  
 chiate foot  $\times 45$ , b, foot, with simple gill  $\times 45$ , c, foot with bifid  
 gill  $\times 45$ , d, posterior falciger  $\times 380$ , e, acicular bristle  $\times 380$ ,  
 f, comb-seta  $\times 380$

*Length* 20-60 mm

*Remarks* The gills commence very far back from the head, at first small and simple, occurring very irregularly, except in the posterior region, where they consist of two filaments, and are longer than the dorsal cirrus, they are missing on incomplete specimens and on the young Such was the case in Crossland's and Augener's specimens The genus *Nicidion* differs only from *Eunice* in wanting gills but already in several so-called *Nicidion*, which

proved to be only varieties or anomalies of *Eunice* species, gills were found in adult specimens, very far from the head. Thus *Nicidion gracilis* is, perhaps, a young specimen, or a variety, of *E. marenzelleri* Grube, as *N. edentulum* is a variety of *E. siciliensis* Grube.

*Occurrence* Mergui, Gulf of Mannar

*Distribution* Australia, Indo-China, Indian Ocean, Mergui, Gulf of Mannar, Zanzibar.

### Genus MARPHYSA Quatrefages.

Prostomium rounded or trilobed. Two bulbous palps. Five tentacles. Two eyes. *Tentacular cirri absent*. Dorsal cirri elongated, ventral cirri short. Gills simple or pectinate. Dorsal setae simple, capillary, ventral setae simple or compound, with knife-like, or sickle-shaped, terminal pieces. Comb-setae. Acicular setae. Lower jaw (labrum) of two pieces. Upper jaw with a pair of mandibles, two pairs of toothed plates, an unpaired plate and sometimes paragnaths.

#### Key to the species of *Marphysa*

*Marphysa corallina* Kinberg, recorded from Madagascar, Red Sea, Cape of Good Hope and Pacific Ocean, has not yet been found in the area of the Indian fauna.

232 *Marphysa sanguinea* Montagu (Fig 123, a-h)*Marphysa sanguinea*, Fauvel, 1923a, p 408, fig 161, (Synonymy), 1932, p 141*Marphysa furcellata*, Crossland, 1903, p 141, pl XV, figs 13-14 Gravely, 1927, p 18

Priostomium bilobed Tentacles short Gills, which begin about 16th-30th foot, attain up to 4-7 filaments, and continue to the hind part of the body Dorsal setae capillary, ventral setae compound, with long knife-like

Fig 123—*Marphysa sanguinea* Montagu a, anterior part, natural size, b, foot from mid-body  $\times 12$ , c, upper jaws, d, lower jaw, e, f, two kinds of comb setae  $\times 80$ , g, acicular bristle  $\times 90$ , h, knife-ended compound bristle  $\times 195$ , *M. bellii* Aud & M-Edw (a species hardly distinct from *M. stragulum* (Grube), i, anterior part  $\times 5$ , k, upper jaws, l, acicular bristle  $\times 120$ , m, falciger  $\times 400$ , n, comb-seta  $\times 100$ , o, cultriform seta  $\times 250$ , p, foot from mid-body  $\times 25$ , q, branchiate foot  $\times 25$

terminal piece Comb-setae very variable, in the posterior segment they are shorter, with a few large teeth Acicular setae irregularly present in the posterior part of the body, sometimes almost entirely missing

**Length:** Up to 300-600 mm.

**Colour** In life pink-gray, iridescent, bright red gills Very brittle Posterior part often regenerated

**Occurrence** Vizagapatam, Pondichery, Gulf of Mannar, Pamban, Tuticorin, Travancore, Mormugao Bay, Goa.

*Distribution* Australia, New Caledonia, Indian Ocean, Red Sea, Atlantic Ocean, Mediterranean Sea

233 *Marphysa macintoshi* Crossland.

*Marphysa macintoshi*, Crossland, 1903, p 137, pl XIV, fig 3—6  
Fauvel, 1930, p 28

Body long, slender, nearly cylindrical Prostomium broad, undivided, horse-shoe shaped Setae and branchiae as in *M. sanguinea* Montagu

*Length* 200—300 mm by 4 mm

*Colour* No regular pigmentation

*Occurrence* Krusadai Island

*Distribution* Indian Ocean, India, Red Sea, Zanzibar

234 *Marphysa graveleyi* Southern.

*Marphysa graveleyi*, Southern, 1921, p 617, pl XXIV, fig 13  
Graveley, 1927, p 19 Fauvel, 1932, p 142

Prostomium bilobed. Tentacles subequal, a little longer than the prostomium The gills, which begin about 36th—52nd foot, and attain up to 8—9 filaments continue to the hind part of the body Dorsal setae simple, capillary In the posterior segments the ventral compound setae, with knife-like terminal piece, are gradually replaced by capillary setae Bifid acicular bristles Body flattened

*Length* Up to 240—270 mm by 5 mm

*Occurrence* Chilka Lake, Adyar, Madras (in brackish water).

235 *Marphysa mossambica* Peters

*Marphysa mossambica*, Fauvel, 1919, p 380 (Synonymy), 1932, p 142 Crossland, 1903, p 139, pl XV, figs 7—10 Graveley, 1927, p 19 Monro, 1931, p 45

*Nauphanta novae-hollandiae*, Kinberg, 1857—1910, p 43, pl XVI, fig 23

Prostomium bilobed Tentacles longer than the head The gills which begin about 30th—33rd foot, attain to 7—8 filaments, and continue to the hind part of the body Dorsal and ventral setae simple Compound setae missing altogether

*Length* Up to 280 mm

*Occurrence* Singapore, Nicobar Islands, Nankauri, in Coral Reefs, Pondichery, Kilakarai, Gulf of Mannar

*Distribution* Philippine Islands, Australia, Bay of Bengal, India, Red Sea, East Africa

236. *Marphysa stragulum* (Grube). (Fig 123, *i*—*q*)

*Eunice stragulum*, Grube, 1878, p 163

*Marphysa stragulum*, Crossland, 1903, p 136

Body slender, elongated Prostomium broad, rounded, undivided Tentacles slightly longer than the head The gills, which begin about the 12th—13th foot, are very large, with numerous filaments, covering the back entirely, but present only on 12—20 segments Dorsal setae simple, capillary Ventral setae compound, with a long knife-like terminal piece In the posterior feet falcigerous setae Acicular setae pale, unidentate

*Length* 20—90 mm by 2—4 mm

*Occurrence* Ceylon, Cochin State Coast

*Distribution* Philippine Islands, Ceylon

*Note*—This species is hardly distinct from *M bellu* Aud Edw

237. *Marphysa fallax* Marion and Bobretzky (Fig 124, *o*—*v*)

*Marphysa fallax*, Fauvel, 1923a, p 410, fig 162, *o*—*v*

*Marphysa chevalensis*, Willey, 1905, p 282

Body long and slender Prostomium rounded, bilobed Branchiae, with 1—3 filaments, from about 10th—14th foot, absent on the 15—20 last ones Upper setae simple, inferior ones of two kinds (1) compound falcigerous with bidentate end-piece, (2) compound with knife-like end-piece. Comb setae Acicula yellow Acicular setae bidentate

*Length* 15—40 mm

*Colour* Back red, with white dots, second segment pale (In life) Mimics a *Lysidice*

*Occurrence* Cheval Paar, Gulf of Mannar

*Distribution* Gulf of Mannar, Atlantic Ocean, Mediterranean Sea, Alexandria, Adriatic Sea, English Channel

Genus PARAMARPHYSA Ehlers

Differs from *Marphysa* in the absence of branchiae

238 *Paramarphysa orientalis* Willey

*Paramarphysa orientalis*, Willey, 1905, p 283, pl IV, fig 105  
Fauvel, 1939, p 336, Okuda, 1937, p 287, figs 42—33

Prostomium bilobed. Tentacles short. Two eyes  
*Gills absent* Acicula and acicular bidentate setae dark  
 Upper setae simple, capillary Comb-setae with long marginal laciniae Compound setae all with falcigerous bidentate end-piece

*Length* 10–28 mm by 1 mm 90–104 setigerous segments

*Occurrence* Cheval Paar, Gulf of Mannar.

*Distribution* Pacific Ocean, Palau Islands, Indo-China, Gulf of Siam, Pulo Condore, Ceylon.

### Genus *LYSIDICE* Savigny

Three tentacles Tentacular cirri absent Dorsal and ventral cirri Branchiae absent Setae simple capillary, comb-like, compound falcigerous and acicular setae Lower jaw (labrum) of two pieces Upper jaw with a pair of mandibles, two toothed plates, an unpaired plate and paragnaths

#### 239. *Lysidice collaris* Grube. (Fig. 124, *a–g*)

*Lysidice collaris*, Marenzeller, 1879, p. 28, pl. V, fig. 2 Fauvel, 1917, p. 236 (Synonymy), 1932, p. 143 Gravely, 1927, p. 19  
 Monro, 1931, p. 45 Willey, 1905, p. 284

*Lysidice sulcata*, Treadwell, 1902, p. 200, fig. 47

(?) *Lysidice fallax*, Ehlers, 1898, p. 15

Eyes reniform or semilunar *Lysidice fallax* Ehlers, often met with, like the "Palolo" worm, in swarms, is probably the epitocous condition of *L. collaris*, with large eyes, provided with a lens

*Length* 50–150 mm

*Colour* Preserved specimens are generally more or less completely colourless or light brown. Sometimes there are still traces of the white ring near the anterior end

*Occurrence.* Singapore, Andaman Islands, Kilakarai, Pamban, Ceylon, Maldivé Archipelago

*Distribution.* Japan, Gambier Islands, New Caledonia, Philippine Islands, Australia, Gulf of Siam, Indian Ocean, Persian Gulf, Red Sea

*Note*—Differs from *L. nmetta* Aud. and M.-Edwards only by the shape of its eyes, reniform instead of rounded

## Genus NEMATONEREIS Schmarda

Body filiform. A single tentacle, no palps. 2–4 eyes. No tentacular cirri. Dorsal and ventral cirri present. Branchiae absent. Simple capillary setae, comb-setae, falcigerous compound setae, acicular setae. Lower jaw of two pieces. Upper jaw with a pair of mandibles, two pairs of jaws, an unpaired plate.

240 *Nematonereis unicornis* Grube (Fig 124, h–n)

*Nematonereis unicornis*, Fauvel, 1923a, p 412, fig 162, h–n, 1927, p 28. Willey, 1905, p 284.

Prostomium rounded anteriorly. Two large posterior eyes, with, sometimes, a smaller anterior pair. An occipital spindle-shaped tentacle. Dorsal cirri subulate. Ventral cirri pyriform. Acicula dark. Acicular setae bidentate, dark. Compound setae falcigerous, bidentate. Comb-setae. Upper setae simple, capillary, limbate.

Fig 124—*Lysidice ninetta* Aud & M-Edw, (only differing from *L. collaris* Grube in the shape of the eyes, which are rounded) a, anterior part  $\times 3$ , b, upper jaws, c, anterior foot  $\times 20$ , d, foot from mid-body  $\times 20$ , e, comb seta  $\times 310$ , f, acicular bristle  $\times 235$ , g, falciger  $\times 310$ . *Nematonereis unicornis* Grube h, anterior part  $\times 5$ , i, anterior foot  $\times 120$ , j, foot from mid-body  $\times 120$ , k, falciger  $\times 350$ , l, acicular bristle  $\times 300$ , m, comb-seta  $\times 350$ , *Marphysa fallax* Mar & Bobr o, anterior part, p, lower jaw, q, upper jaws, r, foot from mid-body, s, bidentate falciger, t, comb-seta, u, acicular bristle, v, cultriform compound bristle.

*Length.* 150–200 mm by 1 mm.

*Colour* Pink, iridescent, anteriorly orange, posteriorly greenish

*Occurrence* Gulf of Mannar, Pamban, Krusadai, Cheval Paar

*Distribution* Malay Archipelago, Indo-China, Indian Ocean, India, Suez Canal, Atlantic Ocean, Mediterranean Sea

#### Sub-family *LYSARETINAE* Kinberg

No palps Three tentacles Very large flattened dorsal cirri. Branchiae absent All setae simple Four anal cirri. Mandibles toothed Jaws more or less symmetrical

#### Genus *AGLAURIDES* Ehlers

Syn *Aglaura* and *Oenone* Savigny

Prostomium rounded Eyes present Palps absent Three short tentacles more or less hidden under the anterior border of the peristomium Nuchal organs protrusible Parapodia sesquiramous Dorsal cirri large, thick, flattened Setigerous lobe with two unequal ligules Setae simple, capillary. Acicular setae Lower jaw of two pieces. Upper jaw with five pairs of symmetrical or asymmetrical toothed plates and two long supports

#### 241. *Aglaurides fulgida* Savigny (Fig 125, a–f).

*Aglaurides fulgida*, Willey, 1905, p 284, pl V, fig 107 Michaelson, 1892, p 9 Fauvel, 1917, p 240, pl VI, figs 52–55 (Synonymy), 1930a, p 31, 1932, p 151

*Aglaurides erythraeensis*, Gravier, 1900, p 278, pl XIV, figs 99–103 Fauvel, 1914d, p 131, pl VII, figs 1–4

*Aglaurides symmetrica*, Fauvel, 1919, p 388

*Oenone fulgida*, Augener, 1913, p 290 Crossland, 1924, p 85, figs 106–111

Prostomium rounded Two pairs of eyes, anterior large, posterior small Tentacles very short, rounded Peristomium biannulate on the sides, with longitudinal ventral folds Dorsal cirri chopper-shaped Anterior ligule short, rounded, posterior ligule more elongated Acicular setae yellow, bidentate, hooded Upper jaw plates very variable in shape One pair of mandibles and four pairs of toothed plates

*Length* 100–250 mm by 5–10 mm.

*Colour* Orange above, light yellow at sides and below.

*Occurrence* Singapore, Meigui Archipelago, Paway Island, Nicobar Islands, Nankauri, Kilakarai, Pedro Shoal, Ceylon, Colombo, Maldive Archipelago

Fig 125—*Aglaurides fulgida* (Savigny) *a*, var *asymmetrica*, upper jaws, dorsal view of the plates  $\times 16$ , *b*, var *symmetrica*, upper jaws, plates flattened  $\times 16$ , *c*, 70th foot  $\times 25$ , *d*, 13th foot  $\times 25$ , *e*, head, *f*, acicular bristle  $\times 134$

*Distribution* Polynesia, Australia, Philippine Islands, Indo-China, Nicobar Islands, Ceylon, India, Maldive Archipelago, Persian Gulf, Red Sea, Atlantic Ocean, Gulf of Guinea, West Indies, Florida

#### Sub-family ONUPHIDINAE Levinsen

Two globular palps, two frontal tentacles (frontal palps), five occipital tentacles Anterior feet more or less modified Gills simple, or pectinate, or spiral Capillary setae, compound or pseudo-compound setae only on the first setigerous segment, comb-setae Four anal cirri A labium, upper jaws 3–5 pairs with an odd plate

#### Genus DIOPATRA Audouin and Milne-Edwards

Head rounded Two pad-like palps Two small oval frontal tentacles Five long occipital tentacles borne on long ringed ceratophores An achaetous segment bearing two small tentacular cirri Dorsal cirri subulate

Ventral cirri subulate in a few anterior feet, the following ones pad-like Pseudo-compound bristles in the anterior feet, succeeded by simple setae, comb-setae and acicular setae Gills large, with a number of filaments inserted spirally Lower jaw (labium) of two pieces Upper jaw with a pair of mandibles, three pairs of toothed plates and an unpaired one Tube membranaceous, sticking in the sand or mud

242 *Diopatra neapolitana* Delle Chiaje (Fig 126, a—h)

*Diopatra neapolitana*, Fauvel, 1923a, p 419, fig 166, a—h (Synonymy), 1930, p 29, 1932, p 144, 1933, p 28 Crossland, 1903, p 132, pl XIV, fig 1

*Diopatra amboinensis*, Willey, 1905, p 274, pl IV, figs 95—97

*Diopatra variabilis*, Southern, 1921, p 611, pl XXV, fig 14

(?) *Diopatra phyllocirra*, Schmarda, 1861, p 133, pl XXXII, fig 261

Body large and very long, rounded anteriorly, depressed and brittle in the posterior region Palps small, glo-

Fig 126—*Diopatra neapolitana* Delle Chiaje a, anterior part  $\times 2\frac{1}{2}$ , b, 10th foot with gills  $\times 8$ , c, foot from mid-body  $\times 8$ , d, comb-seta  $\times 120$ , e, acicular bristle  $\times 120$ , f, hook from 3rd setigerous segment  $\times 120$ , g, spinulose capillary bristle  $\times 80$ , h, kneed aciculum  $\times 45$  *Hyalinoecia tubicola* (O F Muller), i, anterior part (after McIntosh), k, foot from mid-body  $\times 80$ , l, 12th foot  $\times 80$ , m, first setigerous segment  $\times 45$ , n, comb-seta  $\times 310$ , o, acicular bristle  $\times 310$ , p, hook from first foot  $\times 195$ , q, winged capillary bristle  $\times 195$

bular. Ringed ceratophore of tentacles much shorter than the palpostyle. Two anterior tentacles shorter than the three posterior ones, which are subequal. Eyes absent. Gills begin on 4th or 5th foot. They are very large, covering the back, but decrease in size and disappear about the 50th—70th foot. On the first 4—5 setigerous segments, simple winged setae and pseudo-compound bristles, ending in a bidentate hook with a sharp pointed hood. In the succeeding feet, simple setae with two wings and comb-setae with numerous fine teeth, or a few large teeth. Hooded acicular setae bidentate. A number of yellow, tapering, geniculate acicula. Membranous tube partly buried in sand, the upper part thick, tough, more or less coated with debris.

*Length* 150—500 mm

*Colour* Body pale yellow, nidescent, back and feet with white dots. Branchiae with green spiral streaks. In spirit, yellowish with brown spots.

*Occurrence* Burma, Mergui, Gangetic Delta, Orissa Coast, Madras Coast, Ceylon, Gulf of Mannar, Maldive Archipelago.

*Distribution:* Pacific Ocean, China Sea, Gulf of Siam, Indian Ocean, Arabian Sea, Gulf of Oman, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea.

### Genus *ONUPHIS* Audouin and Milne-Edwards

Head rounded. Eyes present or absent. Two pad-like palps. Two small fusiform frontal tentacles. Five occipital tentacles borne on long ringed ceratophores. An achaetous segment bearing two small tentacular cirri. Dorsal cirri subulate, ventral cirri subulate in the anterior feet, pad-like in the succeeding region. Pseudo-compound bristles in the anterior feet, succeeded by simple setae, comb-setae and acicular setae. Gills simple or pectinate. Lower jaw (labrum) of two pieces. Upper jaw with a pair of mandibles, 2—3 pairs of toothed plates and an unpaired plate. Tube membranaceous, sometimes free.

### 243 *Onuphis dibranchiata* Willey.

*Onuphis dibranchiata*, Willey, 1905, p. 277, pl. IV, fig. 100.  
Gravely, 1927, p. 20, pl. IX, fig. 7.

Gills begin as a simple filament on the first foot and continue simple on the first 17 parapodia, thereafter becoming bifid and considerably longer than the dorsal cirri. First dorsal cirrus tumid at the base, rather shorter than the first filament. Pseudo-compound bristles with bi- or tri-dentate terminal piece in the first 3—5 feet. Tentacles with long ringed ceratophores. Tube covered with coarse sand grains.

*Width.* 3 mm.

*Occurrence* Lagoon, Krusadai Island.

### 244. *Onuphis furcatosetosa* Monroe (Fig. 127, a—b).

*Onuphis furcatosetosa*, Monroe, 1937, p. 290, fig. 15

The gills have a *woolly appearance*. They begin on the first foot with two minute filaments and rapidly increase to 18 about the 15th foot and remain *highly ramified*. The first 3 setigers have flattened capillary bristles and the place of the usual compound hooks is taken by curious simple, or incipiently pseudo-compound, bristles having a very slight and scarcely noticeable notch, marking the place where the usual articulation is found, and very long hoods the ends of which are prolonged into two tapering points which form a *terminal fork*. Inside the hood an ill defined bidentate hook can be seen. Tubes formed of mud.

*Length.* 35 mm. by 3 mm.

**Colour.** A brown streak on the head and brown transverse segmental bands in the anterior region

**Occurrence** Gulf of Oman, Gulf of Aden, Red Sea, at depths of 186–375 m

Fig 127 —*Onuphis furcatoscelosa* Monro a, 12th foot, b, forked bristle (after Monro) *O. auchlandensis* Augener, c, hook from first foot  $\times 225$ , d, comb seta  $\times 350$ , e, acicular bristle from mid body  $\times 225$  (after Augener) *O. holobranchiata* Marenzeller f, compound hook from 3rd foot  $\times 260$ , g, 33rd foot  $\times 28$ , h, first foot (after Marenzeller)

245 *Onuphis conchylega* Sars (Fig 128, a–m)

*Onuphis conchylega* Sars, Fauvel, 1923a, p 145, fig 164, (Synonymy), 1932, p 145 Willey, 1905, p 276

All the branchiae are simple and begin about 11th–13th foot First and second feet larger and pointing forwards with a few stout, blunt, simple hooks, replaced in the third foot by pseudo-articulate, uni- or bi-dentate bristles Tube membranaceous, flattened, coated with mud and shells

Length 100–150 mm

Colour Variable, body anteriorly with transverse brown stripes

Occurrence Andaman Sea, Gulf of Mannar, Ceylon

Distribution Indian Ocean, Atlantic Ocean, Mediterranean

Fig 128—*Onuphis conchylega* Sars a, b, anterior part, dorsal and ventral view  $\times 3$ , c, first foot  $\times 23$ , d, 8th foot  $\times 23$ , e, 20th foot  $\times 23$ , f, tube, reduced, g, comb-seta  $\times 310$ , h, acicular bristle  $\times 117$ , i, pseudo-compound bristle  $\times 117$ , j, hook from 2nd foot  $\times 78$ , k, winged capillary  $\times 78$ , l, capillary bristle  $\times 78$

246 *Onuphis holobranchiata* Marenzeller (Fig 127, f–h)

*Onuphis holobranchiata*, Marenzeller, 1879, p 132, pl IV, fig 1  
 Willey, 1905, p 278, pl IV, fig 101 Angener, 1913, p 283  
 Crossland, 1903, p 155, pl XVI, fig 2 Fauvel, 1930a, p 30,  
 1932, p 146

Gills all simple, beginning on the first foot Eyes more or less conspicuous Pseudo-compound bristles on the first four feet, with bi-dentate or tri-dentate terminal piece

Length 40 mm

Colour Transverse pigment streaks on the anterior segments.

*Occurrence* Nankaiu, Nicobar Islands, Gulf of Mannar.

*Distribution* Japan, Nicobar Islands, Gulf of Mannar, Maldive Archipelago

- 247 *Onuphis aucklandensis* Augener (Fig 127, c-e)  
*Onuphis aucklandensis*, Augener, 1924, p 418, fig 11 Fauvel, 1932, p 146  
*Onuphis tenuisetis*, Benham (non McIntosh), 1909, p 5

Gills begin on the second foot, and are pectinate on the 3rd-4th feet, and attain to 6-7 filaments. Tentacles long, reaching to 24th-27th segment, with short ringed ceratophore. Bi- or tri-dentate pseudo-compound hooks in the first 3 feet. Eyes absent.

*Length* 8-120 mm by 6-7 mm

*Occurrence.* Andaman Islands; Off Puri, Orissa

*Distribution* New Zealand, Andaman Islands, India

- 248 *Onuphis eremita* Audouin and Milne-Edwards (Fig 129, a-l)  
*Onuphis eremita*, Fauvel, 1923a, p 414, fig 163 (Synonymy), 1932, p 146

Fig 129—*Onuphis eremita* Aud & M-Edw a, anterior part  $\times 3$ , b, first foot  $\times 12$ , c, 7th foot  $\times 12$ , d, foot from mid-body  $\times 12$ , e, 16th foot  $\times 12$ , f, hind foot  $\times 12$ , g, upper jaws, h, acicular bristle  $\times 117$ ; i, compound hook from 5th foot  $\times 117$ ; k, compound hook from 2nd foot  $\times 117$ , l, comb-seta  $\times 310$

*Onuphis basipicta*, Willey, 1905, p 275, pl IV, figs 98, 99  
Augener, 1926, p 457

*Onuphis landanaensis*, Augener, 1918, p 339, pl V, figs 135—138, pl VI, fig 197

Gills begin on the first foot, simple on the 10—22 succeeding feet, pectinate in the succeeding region, and attain 5—6 filaments Pseudo-compound bristles with bi- or tri-dentate terminal piece, in the first 3—5 feet Tentacles with long, ringed ceratophores Eyes absent

*Length* 80—120 mm

*Colour* Back violet, ventral side white In spirit, yellowish-grey, undescent, with brown spots

*Occurrence* Akyab, Burma, Mergui Archipelago, Madras, Ceylon, Galle and Trincomali

*Distribution* Indo-China, Bay of Bengal, India, Madagascar, Suez Canal, Atlantic Ocean, Mediterranean Sea.

249 *Onuphis investigatoris* Fauvel. (Fig 130, a—f, 131, a—g).

*Onuphis investigatoris*, Fauvel, 1932, p 147, fig 21, pl VI, figs 1—6

Body elongated, depressed, about the same breadth all over, except the first 5—6 segments which are rounded, longer and narrower Segments numerous Palps oval globular Two small oval or sub-cylindrical front tentacles Five occipital tentacles with short, ringed, ceratophore and long, smooth, subulate cirrostyle Median tentacle reaching backwards to the 7th setigerous segment, the outer pair reaching to the 15th Eyes absent Buccal segment (peristomium), which is shorter and narrower than the succeeding, bears two smooth filiform, tentacular cirri inserted in its anterior margin behind the lateral posterior tentacles Dorsal cirri subulate in the first feet, swollen at their base in the succeeding ones Ventral cirri subulate in the 6—7th feet *There is no conical tubercle between the setigerous process and the base of the dorsal cirrus* Gills begin on the 5th—6th foot, simple (or rarely bifid), bifid on the intermediate region, pectinate further back, with as many as 10 filaments They continue to the last segments where they are again simple Posterior ligule well developed in the first feet, in form of a short conical knob about the 12th—15th foot The change is progressive Pygidium, an oval knob with two long filiform cirri Up to the 5th—6th setigerous seg-

ment, capillary setae and pseudo-compound hooks with bi-dentate or tri-dentate hooded terminal piece. In the succeeding segments, winged capillary setae and yellow,

Fig 130—*Onuphis investigations* Fauvel, a, first foot  $\times 20$ , b, fourth foot  $\times 20$ , c, Sixth foot  $\times 20$ , d, tenth foot  $\times 20$ , e, 30th foot  $\times 20$ , f, foot from mid-body  $\times 20$

bi-dentate, hooded acicular setae. From about the 10th—15th foot, yellow acicula ending in a capillary tip. A bundle of very slender capillary acicula enclosed in the base of the dorsal cirri. Lower jaw soft, chitinous, elongate, with blackish outer edge. Jaws soft, pale edged, light brown. M I, 1+1 mandibles without basal teeth, M II, 9+9, M III, 10+10, M IV, 7+12 to 13, with a triangular, dark, chitinous plate at the base. Tube thin, membranaceous, more or less coated with fine mud. A deep sea species.

*Length* Up to 60 mm, or more, by 4–5 mm

*Colour* Discoloured in alcohol

*Occurrence* Laccadive Sea, Arabian Sea, Gulf of Oman, Persian Gulf, 35 fms to 600–700 fms, in brown mud, grey mud, green mud or globigerina ooze

Fig. 131 — *Onuphis investigatoris* Fauvel *a, b*, hooks from first foot  $\times 270$ , *c, d*, hooks from 4th foot  $\times 270$ , *e*, hooded hook from mid-body  $\times 270$ , *f*, worn hook from mid-body  $\times 270$ , *g*, hook enclosed in a foot from mid-body  $\times 270$

### Genus HYALINOECIA Malmgren

Eyes present or absent Two pad-like palps Two small fusiform frontal tentacles Five occipital tentacles, borne on ringed ceratophores *An achaetous segment devoid of tentacular cirri* Dorsal cirri subulate in the anterior feet, pad-like in the following ones Simple or pseudo-compound hooks in the anterior feet, simple capillary setae, comb-setae and acicular setae in the succeeding ones Gills generally simple Lower jaw of two pieces Upper jaw with a pair of mandibles, 2–3 pairs of toothed plates and an unpaired plate Tube membranaceous or horny, sometimes free

250 *Hyalinoecia tubicola* O F Muller (Fig 126, i—q)

*Hyalinoecia tubicola*, Fauvel, 1923a, p 421, fig 166, i—g, 1932, p 149 Augener, 1924, p 422 Monro, 1937, p 293

*Onuphis tubicola*, Ehlers, 1908, p 83

*Hyalinoecia camiguina*, Grube, 1878, p 142 Willey, 1905, p 279

Gills simple, beginning about 18th—26th foot The first two pairs of feet rather stout and pointing forwards, armed with simple capillary setae and stout hooks, bluntly bi-dentate and hooded (on young specimens they are pseudo-compound) Tube free, horny, transparent cylindrical, very slightly bent, open at both ends and provided with internal valves It has the appearance and rigidity of a large goose quill

Length of the tubes 20—200 mm by 8—10 mm Hyaline, colourless or yellow Animal up to 215 mm

Occurrence Bay of Bengal, Laccadive Sea, Arabian Sea, Gulf of Oman, in deep dredgings, down to 1,005 fms

Distribution Japan, New Zealand, Indian Ocean, Red Sea, Atlantic Ocean, Mediterranean Sea

Genus RHAMPHOBRACHIUM Ehlers

Two pad-like palps Two small rounded frontal tentacles Five occipital tentacles, borne on ringed ceratophores An achaetous segment bearing two small tentacular cirri Dorsal cirri subulate Ventral cirri pad-like Three anterior feet very large, directed forwards and bearing very long capillary bristles with a hooked end-piece Gills pectinate Lower jaw of two pieces Upper jaw with a pair of mandibles, paired tooth-plates and an unpaired plate. Tube membranaceous

Key to the species of *Rhamphobrachium*

Compound bi-dentate hooks confined to the 4th foot *diversosetosum* Monro, p 262

Pseudo compound tri-dentate hooks on the 3rd foot *chuni* Ehlers, p 261

251 *Rhamphobrachium chuni* Ehlers (Fig 132, a—b)

*Rhamphobrachium chuni*, Ehlers, 1908, p 76, pl IX, figs 6—15 Augener, 1927, p 178, fig 8 Fauvel, 1932, p 150

Tentacles short, subulate, nearly equal, borne on short ringed ceratophores Eyes absent The three anterior feet flattened, nearly imbricated, directed forwards

and enclosing the head, provided with subulate dorsal and ventral cirri and very long and slender setae ending in a pseudo-articulate tri-dentate hook enclosed in a hood (it is smooth in grown-up specimens) Gills begin about 12th foot and consist of as many as 6 filaments Tube membranaceous, covered with mud

*Length* 190 mm by 4 mm.

*Colour* Yellowish-grey with small dark dots on the anterior part and larger spots on the base of the dorsal cirri

*Occurrence* North Andaman Island S W of Ceylon, 480 fms, Laccadive Sea, 719 fms

*Distribution* New Zealand, Australia, Andaman Islands, Ceylon, Laccadive Sea, East Coast of Africa

252. *Rhamphobrachium diversosetosum* Monro (Fig 132, c-h).

*Rhamphobrachium diversosetosum* Monro, 1937, p 295, fig 17

Palps globular, frontal tentacles ovate Occipital tentacles slender, with short ceratophores Two small eyes The three anterior feet are elongated and carried

Fig 132—*Rhamphobrachium chuni* Ehlers a, anterior part, side view  $\times 4$ , b, 34th foot  $\times 20$  (after Ehlers) *Rh diversosetosum* Monro c, 2nd foot, bristles not figured, d, 4th foot, e, compound bristle from 10th foot, f, hook from 4th foot, g, acicular bristle, h, tip of hook from 2nd foot (after Monro)

forwards beside the head they have large dorsal and ventral cirri and carry a cirriform process and the usual enormously long bristles with curved tip. There is no tri-dentate hook. *The 4th foot carries capillary bristles and compound bi-dentate hooks with sickle-shaped ends. These compound bristles are confined to the 4th foot.* For about the following 10 setigers the place of the compound bristles with sickle-shaped blades is taken by compound bristles with cultriform blades, which in turn disappear, their place being taken by a pair of yellow, bi-dentate, hooded, acicular hooks, and the four acicula are replaced by a pair of stout acicula with pointed ends. Comb-setae present. Gills begin with a simple filament at the 10th setiger and reach a maximum of about 8 filaments. On the terminal segment (52nd) of the larger fragment the gills are still richly branched.

*Length* 19–30 mm by 3 mm and 52 setigers (incomplete)

*Occurrence* Maldivé Archipelago, 183–274 m

#### Sub-family LUMBRICONEREINAE

Palps absent. Tentacles missing. Prostomium more or less conical. Dorsal cirri rudimentary or missing. No ventral cirri. Branchiae absent, or very rarely present. Setae simple winged capillary, compound or simple hooks. Four anal cirri. A lower jaw (labrum). Upper jaws 3–5 pairs, without unpaired plate.

#### Genus LUMBRICONEREIS Blainville

Body long and cylindrical. Prostomium conical or globular, devoid of palps and tentacles. Eyes absent. First two segments apodous and achaetous. Dorsal cirri absent or reduced to a small knob. Ventral cirri absent. Gills absent. Feet with two unequal ligules. Simple winged setae and simple or compound hooks. Lower jaw (labium) bodica-like. Upper jaw with a pair of mandibles, three pairs of toothed plates and two supports.

#### Key to the species of *Lumbriconereis*

253. *Lumbriconereis simplex* Southern (Fig 133, g—i)

*Lumbriconereis simplex*, Southern, 1921, p 625, pl XXVI, fig 16

Prostomium triangular, with rounded angles Feet very vascular, with a large heart-shaped structure full of blood Anterior lobe rounded, posterior lobe blunt conical *All the setae are simple, capillary*, more or less broadly winged There are no hooks Mandibles broad, fused throughout almost the whole length Carriers short Maxillae stout and boldly curved M III, bidentate, M IV, a stout tooth which may be slightly bifid at the tip

*Length* 32 mm by 17—27 mm

*Colourless*, in spirit

*Occurrence* Chilka Lake, in mud

254 *Lumbriconereis polydesma* Southern (Fig 133, a—f)

*Lumbriconereis polydesma*, Southern, 1921, p 622, pl XXVI, fig 15

Very slender elongated body Prostomium rounded Feet uniform in the middle and posterior parts, with an anterior short rounded lobe and a *posterior longer, conical or cirriform one* Only capillary winged setae in the

28 anterior feet, which do not disappear in the middle and posterior feet. The hooks, from the 29th foot, are all unjointed, with 6–10 small denticles above the main fang. M III bi-dentate, M IV unidentate. Acicula colourless.

Length 185 mm. by 1 mm.

Colour: In spirit opaque white with a faint green nudescence.

Fig 133—*Lumbriconereis polydesma* Southern a, anterior end, ventral view  $\times 20$ , b, 80th foot  $\times 80$ , c, 10th foot  $\times 90$ , d, 300th foot  $\times 80$ , e, 3rd and 4th pairs of jaws  $\times 45$ , f, hook  $\times 435$  L. simplex Southern g, anterior end, ventral view, h, 100th foot, showing blood vessels  $\times 60$ , i, 10th foot  $\times 67$  (after Southern)

**Occurrence** In sand just above high water mark, on the shore of Chirya Island, Chilka Lake.

**Remarks** This species is a connecting link between *L. impatientis* Claparède and *L. heteropoda* Marenzeller, differing from the latter by its much shorter feet, which are not erect.

255 *Lumbriconereis latreilli* Audouin and Milne-Edwards (Fig 134, *m-r*)

*Lumbriconereis latreilli*, Fauvel, 1923a, p 431, fig 171 *n-r* (Synonymy), 1932, p 152 Crossland, 1924, p 10, figs 8-40

ments In the anterior feet capillary setae and compound hooks, in the succeeding feet, unjointed hooks The capillaries disappear about 40th-60th feet The variety *japonica* is hardly distinct

Length 50-150 mm

Colour. Pink, red or brown, in life Colour in alcohol red.

*Occurrence* Ceylon, Tuticorin Pearl-Oyster Banks

*Distribution* Pacific Ocean, Indian Ocean, Maldivé Archipelago, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea

256. *Lumbriconereis sphaerocephala* Schmida (Fig 135, c-f)

*Lumbriconereis sphaerocephala*, Augener, 1924, p 424, 1927, p 88 Ehlers, 1904, p 33, pl V, fig 3-11 Fauvel, 1930a, p 30, 1930b, p 540, 1932, p 152

(?) *Lumbriconereis obtusa* Kinberg, Augener, 1926, p 459

Prostomium short, globular Feet with an anterior rounded lobe and a posterior longer conical ligule, slightly more elongated in the posterior feet In the anterior feet, capillary setae and compound hooks with short terminal piece, followed by simple hooks with denticles above the main fang.

*Length* 30-40 mm

*Occurrence* Andaman Islands, Ceylon

*Distribution* New Zealand, New Caledonia, Gambia Islands, Tasmania, Bass Straits, Indo-China, Andaman Islands, India

257 *Lumbriconereis impatiens* Claparède (Fig 134, a-i)

*Lumbriconereis impatiens*, Fauvel, 1923a, p 429, fig 171 a-i (Synonymy), 1932, p 152 Augener, 1918, p 364 Monro, 1937, p 297

Prostomium cylindro-conical Feet with an anterior short, rounded lobe and a posterior longer, conical, or cirriform ligule, slightly erect Acicula yellow In the posterior feet, simple winged and unjointed hooks with denticles above the main fang and a long guard In the middle and posterior feet, the capillaries disappear and the guard of the hooks is shorter

*Length* 150-300 mm

*Colour* In alcohol a lilac-red

*Occurrence* Ganjam Coast, Vizagapatam, Laccadive Sea, Maldivé Archipelago, Persian Gulf

*Distribution* Maldivé and Laccadive Archipelagoes, India, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea

258 *Lumbriconereis heteropoda* Marenzeller. (Fig. 135, g—h)

*Lumbriconereis heteropoda*, Marenzeller, 1879, p 30, pl VI, fig 1 Izuka, 1912, p 141, pl IV, fig 19 Crossland, 1924, p 4, figs 1—7 Fauvel, 1930a, p 30, 1932, p 158 Monro, 1937, p 297

*Lumbriconereis erecta*, Moore, 1903, p 454

Prostomium conical Feet increase in length posteriorly, with posterior cirriform ligule long and often

Fig 135—*Lumbriconereis bifilaris* Ehlers a, anterior part  $\times 20$ , b, 105th foot  $\times 52$  *L. sphaerocephala* Schmarda c, d, anterior part, dorsal and ventral view  $\times 16$ , e, 4th foot  $\times 70$ , f, 60th foot  $\times 52$  (after Ehlers) *L. heteropoda* Marenzeller g, hook; h, hind foot

erect Only simple capillary setae in the anterior feet, followed by winged capillaries and unjointed hooks with small denticles above the main fang

*Remarks* differs from *L. impatiens* Claparède in having only winged capillary setae in the 10–40 anterior feet and the longer posterior ligules erect, or turned backwards, in the middle and posterior feet

*Length* 150–300 mm

*Occurrence* Portuguese India, Mormugao Bay, Bombay, Persian Gulf

*Distribution* Japan, Indo-China, India, Persian Gulf, Red Sea

9 *Lumbriconereis bifilaris* Ehlers (Fig 135, a-b).

*Lumbriconereis bifilaris*, Ehlers, 1901, p 139, pl XVIII, figs 1-10 Fauvel, 1932, p 153

Body long and slender Prostomium long, conical anterior feet with two rounded lips, the anterior shorter than the posterior Posteriorly they gradually change to a very long cirriform processes of about equal length the anterior feet winged capillary setae and unjointed hooks with small denticles above the main fang and a long guard About the 55th foot, only hooks with shorter guard

*Length* About 110 mm by 1 mm

*Occurrence* Taleh-Sap, Gulf of Siam

*Distribution* Coast of Chile, Taleh-Sap, Atlantic Ocean, Coast of Morocco

30 *Lumbriconereis pseudobifilaris* Fauvel (Figs, 136, a-g, 137, a-d)

*Lumbriconereis pseudobifilaris*, Fauvel, 1932, p 154, text fig 22, pl VI, figs 7-13

Body cylindrical, deeply annulated Prostomium conical, rather sharp, eyeless. The first two achaetous segments each about the same size as the following On the ventral side of the peristomium, three longitudinal grooves reaching across the next segment Two large lateral mouth-pads Anterior feet with a short rounded anterior lip and a posterior one tapering at the tip On the succeeding segments the lips, or ligules, of the feet increase in length and become cirriform, but the anterior one remains shorter and blunter than the posterior one Sterigerous lobe rounded, flattened between the lips and bearing only capillary winged setae, which are short in the first segments Farther back, they are less numerous and have a yellow cylindrical shaft and a broad, flattened, transparent, sabre-like distal part ending in a long slender tip, straight or bent *Hooks absent* Several dark acicula Dorsal and ventral cirri absent Lower jaw (labrum) whitish, broad and denticulate Upper jaws, mandibles with long smooth fang destitute of basal teeth, two very

Fig 136—*Lumbriconereis pseudobifilaris* Fauvel a, anterior end, side view,  $\times 9$ , b, anterior end, dorsal view,  $\times 9$ , c, anterior end, ventral view  $\times 9$ , d, anterior foot  $\times 64$ , e, anterior foot, slightly farther back  $\times 64$ , f, foot from mid-body  $\times 90$ , g, posterior foot  $\times 64$

long and slender dark supports, M II, two symmetrical plates with 5 teeth on the right and 8 on the left, M III, two dark hooked plates with several fine denticles on the edge

Fig 137—*Lumbriconereis pseudobifilaris* Fauvel a, b, flat setae  $\times 220$ , c, d, winged setae  $\times 220$

*Length* Up to 40 mm or more by 2 mm

*Colour* In spirit, iridescent pearl-grey

*Occurrence* Off Akyab, Burma, 250 fms. in soft green mud, West Nariakal, Cochin State, Travancore

261. *Lumbriconereis notocirrata* Fauvel (Figs 138, a—h, 139, a—d).

*Lumbriconereis notocirrata*, Fauvel, 1932, p 156, pl VII, figs 1—8, text, fig 23

Body cylindrical, conspicuously annulate, segments up to several hundreds Prostomium blunt, conical, without eyes The first two achaetous segments equal and the same length as the succeeding ones The ventral side

of the peristomium divided into faint longitudinal furrows which do not extend on to the next segment. Two lateral mouth pads. Feet of the anterior segments small, succeeding ones with a setigerous process with two ligules, an anterior short and rounded, and a posterior long and conical, becoming more and more elongated posteri-

Fig 138—*Lumbriconereis notocirrata* Fauvel a, anterior end, dorsal view  $\times 5$ , b, anterior end, ventral view  $\times 5$ , c, foot from mid-body  $\times 25$ , d, anterior foot  $\times 25$ , e, posterior foot  $\times 25$ , f, anterior foot  $\times 25$ , g, foot from mid-body  $\times 25$ , h, semi-anterior  $\times 25$

orly, and erect in the middle region and posterior segments. Dorsal cirrus reduced to a small knob in the anterior feet, long and finger-like in the middle, bent, erect, and translucent in the posterior region, where the feet are long and protruding. In the hind part of the body, a little above and in front of the base of the foot,

the border of the segment protrudes as a small dorsal knob, or a transparent vesicle. Acicula yellow, four in the anterior feet, followed by three, two, or only one, in the posterior feet. A small bundle of very fine acicula enclosed in the base of the dorsal cirrus. In the anterior feet, smooth, sword-like, capillary setae with an unpaired wing, in the succeeding ones, simple setae and simple hook, with bifid tip and rounded guard. In the posterior

Fig. 139—*Lumbriconereis notocirrata* Fauvel. *a*, anterior seta  $\times 270$ , *b*, seta from mid-body  $\times 270$ , *c*, hook  $\times 270$ , *d*, hook-tip  $\times 380$ .

feet, hooks and 1–2 capillary setae. Lower jaw (labrum) black, short, broad, with parallel semi-circular streaks and a faintly denticulate anterior border. Upper jaws with long lanceolate supports. Mandibles with a smooth base, M II, two symmetrical plates with 4+4 teeth, M III, 2+2, M IV, 1+1.

*Length* 350 mm or more, by 8 mm.

*Colour.* In spirit. Pale salmon-colour, with traces of transverse pale brownish-red streaks.

*Occurrence* Vizagapatam, channel connecting backwaters with the sea and beyond the ferry, Orissa Coast, 7 fms

### Genus ARABELLA Grube

Syn *Aiacoda* Schmaida, *Mactovia* Grube

Prostomium ovate, devoid of palps and tentacles  
Eyes present First two segments apodous and achaetous  
Dorsal cirri reduced to a mere tubercle Ventral cirri absent  
Feet with two unequal ligules Simple winged setae  
Lower jaw of two short pieces Upper jaw with a pair of mandibles and 3—4 more or less asymmetrical pairs of toothed plates Two or three long supports.

### Key to the species of *Arabella*

Acicular setae with peculiar asymmetrical hood

*nutans* (Chamberlin), p 275

No such setae

*nicolor* (Montagu), p 274

### 262. *Arabella nicolor* (Montagu) (Fig 140, a—h)

*Arabella nicolor*, Fauvel, 1923a, p 438, fig 175 (Synonymy), 1932, p 158 Augener, 1924, p 430

*Aiacoda multidentata*, Augener, 1913, p 291

Fig 140—*Arabella nicolor* (Montagu) a, b, anterior part, dorsal and ventral view  $\times 4$ , c, lower jaw  $\times 23$ , d, upper jaws  $\times 31$ , e, anterior foot  $\times 39$ , f, hind foot  $\times 39$ , g, upper bristle, kneed and crenulate  $\times 117$ , h, lower winged capillary  $\times 117$  *A geniculata* (Claparède) (a species conspecific with *A nutans* (Chamberlin) ?), i, crenate bristle  $\times 117$ , k, anterior foot  $\times 39$ , l, upper jaws.

Prostomium blunt, conical, with four eyes set near the posterior margin in a transverse line. Dorsal cirri reduced to a small bent knob, often wanting in the posterior part of the body and on young specimens. All the setae are simple, short, stout, geniculate, the upper ones with a denticulate crest, the lower ones with smooth wings. The mandibles are large dark hooks with a toothed base.

*Length.* 50–120 mm

*Colour.* Body grey, iridescent, sometimes with transverse rows of dark dots in the anterior segments.

*Occurrence.* Camorta Island, Nicobar Islands, Madras Coast, Vizagapatam, Gulf of Mannar, Krusadai Island, Pamban, Shingle Island.

*Distribution.* Cosmopolitan, Pacific, Indian and Atlantic Oceans.

263 *Arabella mutans* (Chamberlin) (Fig 140, 1–1, Fig 143, g–i)

*Arabella mutans*, Monro, 1933, p. 88. Fauvel, 1943, p. 24.

*Cenothrix mutans*, Chamberlin, 1919, p. 330, pl. XLI, fig. 1–9, pl. LXII, fig. 1.

*Arabella novecrinita*, Crossland, 1924, p. 71, figs. 89–95.

(?) *Aracoda obscura*, Willey, 1905, p. 285, pl. V, figs. 108–112.

Prostomium a pointed cone with four eyes at its base. Feet prominent though small. Dorsal cirri rudimentary. Setae include (1) capillaries with narrow plain borders, (2) capillaries with broad borders bearing denticles proximally, (3) *acicular setae with peculiar asymmetrical hoods*. Acicula yellow. Jaws almost perfectly symmetrical in var. *logani*, the first pair is nearly so, the second asymmetrical, in var. *asymmetrica*, while one of the first pairs ends in a long slender hook as usual, the other is toothed nearly its whole length, as in the genus *Notocinus*.

*Length.* Up to 500 mm by 2–3 mm.

*Colour.* Flesh colour or orange. Dark in spirit, sometimes with green dots.

*Remarks.* The jaws of *Aracoda obscura* Willey, a very small (16 mm) dark specimen from Ceylon, agree with those of *A. mutans* var. *asymmetrica* Crossland. The specimens from the Maldives belong to the typical form with jaws almost perfectly symmetrical.

*Occurrence.* Ceylon (?), Maldivé Archipelago.

*Distribution.* California, Galapagos Islands; India (?), Maldivé Archipelago, Suez, Zanzibar, Cape Verde Island.

Genus *DRILONEREIS* Claparède

Body elongated cylindrical Prostomium devoid of palps and tentacles Eyes may be present The first two segments apodous and achaetous Dorsal cirri reduced to a mere tubercle Gills and ventral cirri absent Feet with two unequal lobes Simple winged setae and a large acicular spine Lower jaw small, or sometimes missing Upper jaw with a pair of mandibles, a pair of toothed plates, and 2-3 pairs of small hooks

*Key to the species of Drilonereis*

Prostomium small, lanceolate, flattened

*filum* Claparède, p 276

Prostomium almost circular in outline, peculiarly ridged on dorsal surface

*major* Crossland, p 277

264 *Drilonereis filum* Claparède (Fig 141, *a-h*).

*Drilonereis filum*, Fauvel, 1923a, p 436, fig 174, *a-h*, (Synonymy), 1932, p 159

Body long and slender Prostomium lanceolate, flattened, often with a longitudinal median groove Two dark spots at the base Peristomium with ventral longi-

Fig 141 —*Drilonereis filum* Claparède *a, b*, anterior part, dorsal and ventral view, *c*, upper jaws, *d*, lower jaw, *e*, winged capillary  $\times 120$ , *f*, acicular bodkin-like bristle  $\times 120$ , *g*, tip of aciculum  $\times 310$ ; *h*, foot  $\times 8$  *Dr macrocephala* Saint-Joseph *i*, head  $\times 9$ , *j*, upper jaws, *k*, lower jaw, *l*, acicular bristle, (Not yet found in the Indian area)

tudinal folds Feet with an anterior rounded lobe and a posterior long, blunt, conical one Dorsal cirrus reduced to a mere knob with five enclosed acicula Capillary setae with two wings set at an angle *A very large blunt acicular bristle* Acicula with a filiform protruding tip

*Remarks* The dark spots on the back of the prostomium are pigmented nuchal organs

*Length* 40–120 mm by 2 mm.

*Colour* In life pink, yellow or grey-green

*Occurrence* Off Akyab, Burma

*Distribution* Gambier Islands, Bay of Bengal, Persian Gulf, Red Sea, Atlantic Ocean

265. *Drilonereis major*, Crossland (Fig 143, k, l)

*Drilonereis major*, Crossland, 1924, p 57, figs 73–79 Fauvel, 1932, p 159

Body large, up to 430 mm *Prostomium flat, almost semi-circular* in outline, peculiarly ridged on dorsal surface. No sense organs of any kind (?). Setae all simple, the long capillaries slender, but slightly bent and not distinctly bordered A very large blunt acicular bristle Jaws of normal type No teeth on bases of mandibles Accessory plate of supports triangular, generally more or less equilateral Rudiments of labrum usually absent, sometimes conspicuous

*Length.* 200–450 mm. by 3 mm

*Occurrence* Bay of Bengal

*Distribution.* Bay of Bengal, Gulf of Suez

### Genus NINOE Kinberg

Prostomium conical Palps and tentacles absent The first two segments apodous and achaetous *Gills filaments cuniform, sessile.* Simple setae, and hooks Four pairs of upper jaws Labrum of two pieces

266 *Ninoe chilensis* Kinberg (Fig 142).

*Ninoe chilensis*, Kinberg, 1857, 1910, p 45, pl XVIII, fig 32 Ehlers, 1904, p 141 Fauvel, 1932, p 160, pl VII, fig 18

Prostomium conical, rather long, eyeless. Nuchal organs present Dorsal and ventral cirri missing in the anterior feet, further back, a large flattened process above the gills is, perhaps, a modified dorsal cirrus Gills rudimentary on the second foot, they have three filaments on the third and then number may reach beyond 10–12 They are well developed on about 30 segments, then they

dwindle and suddenly disappear. They represent the posterior lip of the feet. Behind the branchial region the feet are like those of *Lumbriconereis*, with a short rounded setigerous process, devoid of cilia, and with simple winged setae and long simple hooks.

Fig. 142—*Ninoe chilensis* Kinberg, twelfth foot  $\times 60$

*Length* 10–30 mm

*Occurrence* Bay of Bengal, 105 fms

*Distribution* Coast of Chile, Bay of Bengal

#### Sub-family STAUROCEPHALINAE

Two palps. Two tentacles. A labium. Upper jaw with four rows of very numerous toothed plates. Parapodia sesquiramous. Simple and compound setae. Dorsal and ventral cirri. Gills absent. Four anal cirri.

#### Genus STAUROCEPHALUS Grube

Syn. *Prionognathus* Keferstein, *Dorvillea* Parfitt, *Stauroneris* Vernill, *Anisoceras* Grube

Two long palps, two tentacles, 2–4 eyes, two nuchal organs. A lower jaw (labrum). Upper jaw, several rows of maxillary teeth on each side. First two segments

achaetous Sesquiamous parapodia Dorsal cirri jointed, ventral cirri unjointed Upper setae simple capillaries, geniculated or forked, lower setae compound, falciger, or spiniger

*Key to the species of Staurocephalus*

Prostomium rounded 1—2 pairs of eyes No nuchal papilla Two tentacles with 6—13 joints, they are not much longer than the palps, which are faintly wrinkled, with a short terminal piece There is no dorsal cirrus on the first segment Dorsal cirri rather short, two-jointed, with the cirriophore longer than the cirrostyle. On the first segment 1—2 capillary setae and a short bent seta. Ventral setae compound, with a long sickle-shaped end-piece, gradually decreasing in size. The forked Y-shaped setae with very unequal limbs, begin on the second setigerous segment. Four anal cirri. Toothed maxillary plates in two rows on each side.

*Length.* 3—8 mm

*Colour.* Light-red

*Occurrence* Shingle Island, Gulf of Mannar

*Distribution:* New Zealand, Australia, Pacific Ocean, Indian Ocean.

268. *Staurocephalus gardineri* Crossland (Fig 143, d—f).

*Staurocephalus (Dorvillea) gardineri*, Crossland, 1924, p 93, figs 112—118

Body of large size. Prostomium rounded, remarkably flattened. Two pairs of eyes (?). Tentacles jointed, same length as wrinkled palps. A nuchal papilla present No dorsal cirrus on the first segment (?). Dorsal cirri long, thick below, *gradually passing to a point, there is no end-joint* It is supported by the usual very slender aciculum A stout aciculum in the foot. Dorsal setae slender, slightly curved, finely denticulated along the convex edge and ending in one or two very minute hooks *No forked setae occur* A longer ventral bundle of compound setae with a long bi-dentate sickle-shaped end-piece of gradually decreasing size, the shaft is not denticulated. Toothed maxillary plates in two rows on each side

*Length.* 50 mm by 2.5—4 mm 100 segments

*Occurrence.* Hulule, Male Atoll, Maldivé Archipelago

*Distribution.* Maldivé Archipelago, Off Wasin, East Africa.

 (?) *Goniada japonica*, Izuka, 1912, p 238, pl XXIII, figs 1-6  
 (?) *Goniada longicirrata*, Monro, 1937, p 285

The prostomium has nine rings, of which the basal ones are larger than the others 60-70 anterior feet uniamous, with a dorsal cirrus, a setigerous process with three ligules, a thick short ventral cirrus, an aciculum and a bundle of compound setae The succeeding parapodia bi-iamous, dorsal iamus with a conical cirrus, foliaceous in the posterior segments, a blunt setigerous process with an aciculum and 2-3 straight, stout, blunt acicular bristles, ventral ramus with a posterior and two anterior tapering ligules, a stout ventral cirrus and a bundle of compound spinigerous setae In the posterior region both rami are widely apart 6-12 V-shaped paragnaths (chevrons) on each side of the proboscis, which is armed with two large, toothed, horny jaws and 25-55 X-shaped paragnaths in a nearly continuous belt.

*Length* 35-350 mm

*Colour* In spirit brownish especially in the posterior part.

*Occurrence* Vizagapatam; Vandrutti, Cochín State

*Distribution* Japan?, Australia?, India, Atlantic Ocean, Mediterranean Sea.

 Fauvel, 1932, p 121, pl III, figs 9-16  
 (?) *Goniada echinulata*, Grube, 1869, p 39

Body divided into anterior cylindrical and posterior somewhat flattened regions Prostomium conical, indistinctly annulate Eyes absent (?). Proboscis thickly covered with pointed, hooked, papillae Two horny jaws with a large hook and 3-4 smaller teeth, 5-6 double, X-shaped, ventral paragnaths and about 15 smaller ones About 20 V-shaped chevrons on each side of the base of the proboscis Anterior region of 48 segments, of which 27 are uniamous and the succeeding 21 already provided with capillary dorsal setae Dorsal cirrus heart-shaped, foliaceous, pedunculate Setigerous lobe with three conical tapering ligules, a thick ventral cirrus, an aciculum and compound heterogomph spinigers A small dorsal ramus with two unequal ligules, an aciculum and 5-6 very slender capillary setae are gradually developed from the 28th foot backwards In the posterior region the dor-

sal ramus consists of a large heart-shaped foliaceous dorsal cirrus, a short setigerous lobe with an aciculum, *two conical ligules* and a bundle of slender simple capillary setae ventral ramus with three triangular, subequal ligules, an

Fig 145—*Goniada annulata* Moore a, 8th foot  $\times 50$ , b, 19th foot  $\times 50$ , c, 39th foot  $\times 50$ , d, 97th foot  $\times 50$ ; e, 112th foot  $\times 50$ , f, dorsal papilla  $\times 88$ , g, hooked papillae  $\times 88$ , h, ventral papillae  $\times 88$

aciculum and a bundle of compound spinigerous setae, and a conical ventral cirrus. The papillae of the proboscis are very peculiar, inserted on a low conical lobed base

*Length.* 50 mm. by 2–3 mm

*Colour:* In spirit whitish, with rusty brown specks

*Occurrence.* South of Ceylon, 660 fms

*Distribution* Gulf of Georgia, North Pacific Ocean, Ceylon.

277. *Goniada eximia* Ehlers (Fig 147, e, f)

*Goniada eximia*, Ehlers, 1901, p 157, pl XX, figs 7—17. Monro, 1936, p 141, fig 25, a—j, 1937, p 285

Body divided into two regions. Prostomium very small, blunt, eyeless. Proboscis densely covered with small kidney-shaped papillae. Two large jaws, each with five teeth, a circle of about 22 small X-shaped paragnaths and a second row of smaller ones, 18 pairs of chevrons in the young, *absent in the adult*. Anterior region with 58—59 unramous feet and the change to biramous is complete about the 96th foot. Anterior feet with a large, flattened, dorsal cirrus, a setigerous lobe with two digitiform ligules and a third, triangular, behind, and a large ventral cirrus, an aciculum and compound heterogomph spinigers. In the posterior region, the dorsal ramus consists of a broad, flattened, dorsal cirrus, a triangular dorsal ligule, of about the same size, an aciculum and a bundle of simple capillary bristles, almost entirely enclosed. In the ventral ramus, the two anterior lips are fused proximally, only their pointed ends remain free and the posterior lip is a *broad flattened structure resembling a tennis racket* in shape with a triangular process at the apex. A broad flattened ventral cirrus. Compound heterogomph falcigers.

*Length* 250—760 mm by 4—13 mm

*Colour* In spirit yellowish-green

*Occurrence* North Arabian Sea, 1519—1705 m.

*Distribution.* Magellan, Falkland Islands, Arabian Sea

## Sub-genus GONIADOPSIS Fauvel

V-shaped paragnaths absent on the sides of the proboscis. Body divided into three regions (1) an anterior, with uniramous parapodia, short cirri and stout falcigerous setae, (2) intermediate, with uniramous parapodia, long cirri and spinigerous setae and (3) a posterior, with biramous parapodia, dorsal acicular setae and long spinigerous ventral setae.

*Key to the species of the sub-genus Goniadopsis.*

Posterior ventral ramus bilobed *incerta* Fauvel, p 286

Posterior ventral ramus trilobed *agnesiae* Fauvel, p 287.

278. *Goniada* (*Goniadopsis*) *incerta* Fauvel (Fig 146, a-k).

*Goniada* (*Goniadopsis*) *incerta*, Fauvel, 1932, p 122, pl. IV, fig 1-10

Anterior and intermediate regions narrowly cylindrical, posterior region broader. Prostomium sharp conical, ringed, with four small tentacles at the tip, and two very small black, widely separated, eyes at the base. Proboscis cylindrical and apparently smooth, but covered with very minute globular papillae. No V-shaped chevrons. An-

Fig 146—*Goniada* (*Goniadopsis*) *incerta* Fauvel a, anterior end, dorsal view, enlarged, b and c, two anterior feet  $\times 50$ ; d, anterior foot with long ventral cirrus  $\times 50$ , e, 37th foot, intermediate region  $\times 60$ , f, one of the first feet with dorsal bristles (about 50th)  $\times 50$ , g, foot of the enlarged biramous region  $\times 50$ , h, posterior foot  $\times 50$ , i, and k, compound bristles from anterior region  $\times 225$

terior region of 23—24 setigerous segments, with uniramous parapodia, including a broad, short, foliaceous dorsal cirrus, a setigerous process with three ligules, one posterior and broadly triangular and two anterior finger-shaped and sub-equal, a thick short club-shaped ventral, cirrus, an aciculum and two bundles of stout compound setae, with a short, rather broad, ciliate end-piece Middle region of about 30 segments, with uniramous parapodia including a long finger-shaped dorsal cirrus, a setigerous process with three ligules, one posterior triangular and two anterior slightly longer, a ventral cirrus twice or thrice as long, an aciculum and two bundles of more slender compound setae, with a long tapering delicately spinose terminal piece Posterior region with conspicuously biramous feet including, in the dorsal ramus, a short cirrus, a bilobed setigerous process, with an aciculum and 2—3 short acicular setae, blunt at the tip, in the ventral ramus, a triangular posterior ligule, two anterior, slightly longer, finger-shaped ligules, a large blunt conical ventral cirrus, an aciculum and two bundles of compound spinigerous setae like those of the middle region

*Length* 50 mm by 1.5—2 mm The single specimen is a female with eggs.

*Occurrence* Off Akyab, Burma, 530 fms

279. *Goniada* (*Goniadopsis*) *agnesiae* Fauvel (Fig 144 a—f)

*Goniada* (*Goniadopsis*) *agnesiae*, Fauvel, 1930, p 32, fig 7, a—f.

Body divided into three regions. the anterior and middle ones slender, cylindrical, and the posterior one somewhat broader and more flattened 150 segments and more Prostomium elongated, tapering conical, ringed, with four slender tentacles at the tip and two small black, widely separated, eyes at the base Proboscis cylindrical, armed with two large pectinate jaws, four bi-dentate paragnaths between the jaws and, on the other side, a semi-circular row of about twelve smaller bi-dentate denticles apparently simple There are no V-shape chevrons Anterior region of about 28 segments, with uniramous parapodia including a broad, short, lanceolate dorsal cirrus, a setigerous process with three ligules, one posterior broadly triangular, and two anterior finger-shaped, unequal, a short ventral cirrus, an aciculum and a bundle of stout compound setae with a short blunt, slightly bent, end-piece Middle region of 39 segments, with uniramous parapodia including a finger-shaped dorsal cirrus,

two ligules, one short, triangular, the other longer, finger-shaped, a ventral cirrus, twice or thrice as long, an aciculum and two bundles of compound setae, thinner than the former, with long, narrow, delicately spinose end-piece. Posterior region with biramous parapodia including, in the dorsal ramus, a short conical cirrus, a blunt setigerous process with an aciculum and two short acicular setae, blunt at the tip, in the ventral ramus, a triangular posterior ligule, an anterior one longer and finger-shaped, a short, thick, ventral cirrus, an aciculum and two bundles of compound spinigerous setae, with a long terminal piece, like those of the middle region.

*Length* 105 mm by 1 mm

*Colour* Bright-red in front, pale ochraceous behind. In the posterior region only, a ventral spot in the middle of each segment.

*Occurrence* Gulf of Mannar, Krusadai Island, in sand, a single specimen, incomplete behind.

### Genus GLYCINDE Muller.

Syn *Eone* Malmgren.

Body divided into two regions. Proboscis beset with papillae. Two big horny jaws and numerous paragnaths. Lateral V-shaped paragnaths (chevrons) absent. Anterior parapodia uniramous, posterior parapodia biramous. Branchiae absent. Dorsal setae acicular, ventral setae compound.

#### 280. *Glycinde oligodon* Southern (Fig 147, a-d).

*Glycinde oligodon*, Southern, 1921, p. 629, pl. XXVIII, fig. 18.  
Fauvel, 1932, p. 123.

Anterior part of the body rounded, middle and posterior regions flat. Prostomium with a basal ocular segment and eight rings. Four small tentacles. Proboscis nearly square in section, with two dorsal bands, each of four irregular rows of transparent, horny, hooked papillae and two ventral bands of smaller soft mammillate papillae. Two large ventral jaws and a dorsal row of 4-5 small denticles. Anterior feet uniramous, with a large, broad, blunt, dorsal cirrus indented near the tip, a rounded setigerous lobe and a longer ligule, and a blunt, thick, conical ventral cirrus, compound spinigerous bristles. Middle and posterior feet biramous, a dorsal cirrus with a short, stout, swollen base, a dark spine accompanied by two or three dark brown setae having a curved tip, and a long,

slender, curved, spine on the crest, a small rounded papilla. Ventral ramus as in the anterior feet, except that the posterior lobe is rather longer and wider.

Fig 147—*Glycinde oligodon* Southern *a*, anterior end, ventral view  $\times 78$ , *b*, 10th right foot, posterior view, setae omitted  $\times 272$ , *c*, 30th foot  $\times 117$ , *d*, 90th foot  $\times 117$  (after Southern) *Goniada eximia* Ehlers *e*, 45th foot, *f*, foot from middle region, front view (after Monro) *Glycera lancadivae* Schmarda *g*, *h*, parapodial ligules (after Willey) *Gl. sagittariae* McIntosh *i*, 30th foot  $\times 31$  (after McIntosh)

**Length** 20 mm 97 segments.

**Colour** The body dark greenish-yellow

**Occurrence** Chilka Lake, on muddy bottom, off Santapalli, Vizagapatam, Bay of Bengal, 840 fms

#### Sub-family GLYCERINAE.

Body not divided into regions Proboscis with only four horny jaws. Gills present or absent.

*Key to the genera of GLYCERINAE*

---

(1) Not yet recorded from India

281 *Glycera tessellata* Grube (Fig 152, a—c)

*Glycera tessellata*, Fauvel, 1923a, p 387, fig 152, 1932, p 124

Branchiae absent Parapodia with two anterior equal elongated lobes and two posterior lobes much shorter, rounded and equal to each other Papillae of the proboscis long and slender Supports of the jaws (ailerons) with two long dagger-like processes

*Length* 15–35 mm

*Colour* White spots on pink ground, in life. In spirit, brown with tessellated pattern

*Occurrence* Andaman Islands, Doarakara, Sunderbans, off Puri, Orissa, Hulule and Heratera Islands, Addu atoll, Maldive Archipelago

*Distribution* Pacific, Indian and Atlantic Oceans

282 *Glycera lancadivae* Schmarda (Fig 147, g, h)

*Glycera lancadivae*, Schmarda, 1861 Michaelsen, 1892, p 12 Willey, 1905, p 286, pl VI, figs 113–116, Fauvel, 1930b, p 540, 1932, p 125 Monro, 1937, p 184

Branchiae absent Parapodia with two anterior, equal, elongated lobes and a single posterior, rounded, slightly emarginate lobe Papillae of the proboscis of two kinds, acuminate, and rounded, destitute of terminal nail-like appendage Supports of the jaws (ailerons) with short unequal processes

*Length* 40–60 mm and more

*Occurrence* Burma, Madras Coast, Ceylon, Laccadive and Maldive Archipelagoes

*Distribution* Burma, Ceylon, Laccadive and Maldive Archipelagoes, Persian Gulf

282 *Glycera longipinnis* Grube (Fig 148, a—d).

*Glycera longipinnis*, Grube, 1878, p 182, pl VIII, fig 9 Fauvel, 1932, p 125, pl IV, figs 11–14

Branchiae simple, large, inserted on the dorsal edge of the foot Parapodia elongated, with two anterior subequal, cirriform lobes, and a single posterior, rounded or faintly emarginate, lobe Papillae of the proboscis long, cylindrical, destitute of terminal nail-like appendage

Supports of the jaws (aleurons) with two long dagger-like processes

Fig. 148—*Glycera longipinnis* Grube a, foot of specimen from Sta 168, with large gills  $\times 35$ , b, branchiate foot of specimen from Sta 292  $\times 35$ , c, abbranchiate foot of the same specimen  $\times 35$ , d, papillae of the proboscis  $\times 117$

Length 100 mm by 2–3 mm

Colour Flesh-brown

Occurrence: Bay of Bengal

Distribution: Philippine Islands, Bay of Bengal, Persian Gulf

284 *Glycera alba* Rathke. (Fig. 149, i–m).

*Glycera alba*, Fauvel, 1923a, p 385, fig 150 (Synonymy), 1932, p 126 Gravelly, 1927, p 9

*Glycera alba* var *cochinensis*, Southern, 1921, p 627, pl. XXVII, fig 17

(?) *Glycera cinnamomea*, Grube, 1874, p 327

Branchiae simple, inserted on the dorsal edge of the foot. Parapodia with two anterior, subequal, triangular or cuneiform lobes and two posterior lobes, the upper one

Fig 149—*Glycera roulei* Aud & M-Edw a, foot from mid body, posterior view  $\times 15$ , b, hind foot  $\times 23$ , c, papillae, d, compound seta  $\times 270$  *Glycera alba* Rathke e, papillae  $\times 190$ , f, jaw's wing  $\times 23$ , g, foot from mid-body  $\times 31$ , h, hind foot  $\times 31$

triangular, shorter than the anterior, the lower rounded and still shorter. Papillae of the proboscis obliquely truncated (unguiculate), with a transparent nail-like appendage. Supports of the jaws triangular, with a single process.

**Length** 60–100 mm. by 3 mm.

**Colour** Milk-white in life, yellowish in spirit.

**Remarks** The variety *cochinensis* differs from the type only in possessing longer branchiae and more acute lobes of the feet.

**Occurrence** Ganjam Coast, Cochin Backwater, Mormugao Bay.

**Distribution** Indian Ocean, India, Red Sea, Atlantic Ocean.

285 *Glycera prashadi* Fauvel (Fig 150, a—h)*Glycera prashadi*, Fauvel, 1932, p 126, pl V, figs 1—8

Body tapering posteriorly, segments bi-annulate, Prostomium acutely conical, faintly ringed, with four very small filiform tentacles. Proboscis long, cylindrical, covered with minute cylindrical unguiculate papillae, obliquely truncated, with a kind of transparent chitinous nail at the tip. Supports (ailerons) of the jaws triangu-

Fig 150—*Glycera prashadi* Fauvel a, support of the jaw (aileron), enlarged, b, joint of compound bristle  $\times 290$ , c and d, papillae of the proboscis, front and side view  $\times 290$ , e, foot from mid-body  $\times 26$ , f, posterior foot  $\times 26$ , g, foot from mid body  $\times 26$ , h, anterior abbranchiate foot  $\times 26$

lar, with unequal, rather long, diverging processes. Parapodia with two equal anterior long, acutely conical, lobes and two equal posterior triangular lobes, but shorter than the anterior ones. Dorsal cirrus globular, knob-like, near the base of the foot. Ventral cirrus triangular, shorter than the posterior lobes. A bundle of simple

dorsal setae Two bundles of ventral compound homogomph bristles with a long terminal piece, winged and finely serrated Posterior feet more elongated and slender

*Length* 8–10 mm by 3–4 mm feet included

*Colour* Discoloured in spirit

*Occurrence* Burma Coast, Meigui, Nankauri, Nicobar Islands, Bay of Bengal, Persian Gulf

286 *Glycera sagittariae* McIntosh (Fig 147, 1, Fig 151, a–d)

*Glycera sagittariae*, McIntosh, 1885, p 346, pl XLII, fig 8, pl XXIIA, fig 10 Treadwell, 1903, p 1174 Fauvel, 1932, p 127, fig 17

Branchiae simple, short, inserted on the dorsal edge of the feet Parapodia with two equal anterior, elongated, tapering lobes, and two equal posterior blunt triangular lobes, but much shorter than the anterior ones Dorsal cirrus more or less remote. Papillae of the proboscis of two kinds short globular or ovate, and long

Fig 151—*Glycera sagittariae* McIntosh a, b, feet, setae omitted  $\times 65$ , c, d, globular and elongated papillae  $\times 150$

slender, without terminal nail-like appendage Supports of the jaws (aileions) with two long dagger-like processes Only an anterior fragment Might be described as a branchiate *Gl. tessellata* Grube

*Occurrence* Seven Pagodas, Madras Coast

*Distribution* Hawaii, Aru Islands, Madras Coast

287. *Glycera gigantea* Quatrefages (Fig 152, d—k)

*Glycera gigantea*, Fauvel, 1923a, p 387, fig 152, d—k (Synonymy), 1932, p 128 Monro, 1931, p 18

*Glycera siphonostoma* D Ch., Augener, 1927, p 138

Branchiae simple, rounded, vesicular, retractile into the anterior side of the feet Parapodia with two anterior, digitiform equal lobes and two very short, rounded,

Fig 152—*Glycera tessellata* Grube a, proboscis papillae  $\times 117$ , b, jaw  $\times 73$ , c, foot from mid-body  $\times 39$  *Glycera gigantea* Quatrefages d, proboscis papillae  $\times 117$ , e, f, jaw's wings  $\times 23$ , g, compound bristle  $\times 190$ , h, foot from young stage  $\times 31$ , i, k, foot from mid-body, front and back view, setae omitted  $\times 15$

slightly unequal lobes Papillae of the proboscis of two kinds a few globular and others elongated, destitute of terminal nail-like appendage Supports of the jaws triangular, with a long process on one side

*Length*: 200—350 mm.

*Colour* Pink anteriorly, grey behind, in life. Yellowish or copperish, in spirit

*Occurrence* Laccadive Sea, 430 fathoms

*Distribution* New Pomerania, Great Barrier Reef, Laccadive Sea, Atlantic Ocean, Mediterranean Sea

288 *Glycera roulei* Audouin and Milne-Edwards (Fig. 149, *a-d*)

*Glycera roulei*, Fauvel, 1923a, p 389, fig 153, *a-c*, 1932, p 128  
Monio, 1937, p 284

*Glycera goesi*, Malmgren, 1867, p 184, pl XV, fig 81, Arwidsson, 1898, p 22, pl I, figs 13-14 Izuka, 1912, p 238, pl XXIV, fig 1-2

*Glycera decipiens*, Maenzeller, 1879, p 140, pl VI, fig 3

(?) *Glycera nicobarica*, Grube, 1867, p 24, pl III, fig 1

Branchiae simple, slender, retractile into the anterior side of the feet Parapodia with two equal anterior pointed lobes and two posterior sub-equal shorter, broader, lobes In the posterior feet, the posterior upper lobe is pointed and the inferior lobe is much shorter and blunt Papillae of the proboscis either globular or lanceolate, conical, destitute of terminal nail-like appendage Supports of the jaws triangular, with a long process on one side. The branchiae being retractile, in preserved specimens very often only a few, or none, are exerted, the animal then appearing as quite abranchiate

*Length* 100-200 mm.

*Colour* Yellowish-brown, in spirit, with, often, feet darker

*Occurrence* Andaman Islands, Chandipore, Orissa Coast, Vizagapatam, Gulf of Mannar, Pamban Backwater, Laccadive Sea

*Distribution* California, Japan, Andaman Islands, India, Persian Gulf, Atlantic Ocean, Mediterranean Sea

289 *Glycera cirrata* Grube (Fig. 153, *a-e*)

*Glycera cirrata*, Grube, 1869b, p 35 Fauvel, 1932, p 129, fig 18

Body large, tapering and very slender posteriorly, numerous bi-annulate segments Prostomium acutely conical, with 11-12 faintly bi-annulate rings and four small terminal tentacles Parapodia with two anterior long, sharp, equal lobes and two posterior similar, but shorter, equal lobes Dorsal cirrus an ovoid knob, inserted near the base of the foot Ventral cirrus sharp, triangular, about the same length as the posterior lobes Branchiae retractile, beginning from about the 17th to the 25th—

30th foot, first simple, long, cirriform, then bifurcate, and next divided into 3, 4 or 5 branches, in the posterior segments they are again simple. They are inserted at the base of the foot, near the dorsal cirrus, on the posterior

Fig 153—*Glycera cirrata* Grube a, b, anterior feet, setae omitted  $\times 34$ , c, foot from mid-body  $\times 34$ , d, posterior foot  $\times 34$ ; e, unguiculate papillae  $\times 110$

side of the upper border of the dorsal ramus. Proboscis long, club-like, beset with cylindrical unguiculate papillae obliquely truncated, with a transparent nail-like appendage at the tip. Supports of the jaws (ailerons) triangular, with an elongated process on one side.

*Length* 10–15 mm by 5 mm, feet included

*Colour* Yellowish in spirit

*Occurrence* Burma, Andaman Islands, Madras Coast

*Distribution* Burma, Andaman Islands, India, Persian Gulf, Red Sea, Brazil

## 290 *Glycera manorae* Fauvel (Fig 154, a–i)

*Glycera manorae*, Fauvel, 1932, p 130, pl V, figs 9–17

Body rather large, tapering posteriorly, segments numerous, bi-annulate. Prostomium acutely conical, with 10–12 rings and four small terminal tentacles. Parapodia with two anterior sharp triangular, mucronate, equal lobes and two posterior nearly equal, similar, but shorter

and more blunt lobes. Dorsal cirrus an elongated knob inserted near the base of the foot. Ventral cirrus triangular, about the same length as the posterior lobes. Posterior feet more slender and elongated. Branchiae retractile, beginning about the 17th foot, first simple, large, digitiform, those following divided into two long, more or less equal, branches. In the posterior feet, they are again simple. They are inserted at the base of the foot on its upper border, or slightly behind, near the dorsal cirrus. On a number of feet, one or two small retractile vesicular

Fig 154—*Glycera manorae* Fauvel. a, papillae of the proboscis  $\times 98$ , b, support of the jaw (aileron)  $\times 21$ , c, joint of compound bristle  $\times 233$ , d, foot from mid-body with bifid gill  $\times 21$ , e, foot with small accessory gill  $\times 21$ , f, posterior foot with simple gill  $\times 21$ , g, anterior foot with large simple gill  $\times 21$ , h, anterior foot with posterior dorsal ligule bilobed  $\times 21$ , i, foot from mid-body with two small accessory gills  $\times 21$ .

gills, of a more or less elongated knob-like shape, are inserted on the posterior side of the foot, slightly behind the superior lobe. Proboscis covered with small cylindrical unguiculate papillae, obliquely truncated, with a transparent nail-like appendage at the tip. Supports of the jaws (aileron) triangular with an elongated process on

one side Dorsal setae capillary, with a narrow wing, they are grouped in two bundles Ventral setae homomorph, compound, or hemigomph with a long, slender, finely serrated terminal piece

*Length* About 70 mm by 5 mm., feet included.

*Colour* In spirit, rusty yellow, pedal lobes very dark at the tip

*Occurrence* Manora Shoal, Karachi

## SEDENTARIA.

### Family ARICIIDAE Aud & M-Edw

Body vermiform, segments numerous, divided into two regions. (1) thorax more or less enlarged, depressed, and (2) abdomen much longer and somewhat cylindrical Prostomium conical, cylindrical or globular, without any appendages Proboscis unarmed Feet biramous, with acicula Gills dorsal, generally simple, ciliate A dorsal cirrus The ventral rami of the thorax are flattened pads with, or without, a fringe of papillae and vertical rows of stout bristles In the abdomen, the ramus is bilobed, erect, with, or without, a ventral cirrus. Sometimes an intermediate cirrus between the two rami Often transverse rows of papillae on the ventral side of a number of anterior segments Setae simple, of many kinds. Lateral sense-organs, and dorsal sense-organs One pair of erect, lanceolate, gills on each segment.

### *Key to the genera of ARICIIDAE*

| Thoracic ventral rami without vertical rows of foot papillae | <i>Scoloplos</i> Blainville, p 306 |

### Genus ARICIA Savigny

Prostomium conical. A pair of erect lanceolate gills on each segment, except on a few anterior ones Thoracic feet with an erect dorsal cirrus and a bundle of serrated capillary setae Ventral ramus pad-like, with vertical rows of stout bristles and foot papillae Often transverse ventral rows of papillae on a few segments In the abdomen, an erect dorsal cirrus, capillary setae and forked setae, sometimes an intermediate cirrus Ventral ramus

bilobed, with capillary setae and a ventral cirrus    Dorsal sense-organs anchor-shaped

*Key to the species of Aricia*

| Intermediate cirrus absent  | <i>exarmata</i> Fauvel, p 304          |

291. *Aricia cuvieri* Aud & M-Edw (Fig 155, 156)

*Aricia cuvieri*, Fauvel, 1927a, p 12, fig 3 e-l (Synonymy), 1932, p 161

*Aricia cuvieri* var *perpapillata*, Eisig, 1914, p 334, pl XI, fig 10, pl XV, fig 18-20, pl XVIII, figs 1-14

Prostomium sharp conical, without eyes 22-24 thoracic segments, with a fringe of 10-15 sharp conical

Fig 155—*Aricia cuvieri* Aud and M-Edw e, forked bristle  $\times 400$ , f, hook  $\times 160$ , g, 10th foot  $\times 20$ , h, 75th foot  $\times 25$ , i, dorsal aciculum  $\times 160$ , k, ventral abdominal aciculum  $\times 160$ , l, anterior region, side view  $\times 4$

foot papillae, 3–5 vertical rows of large yellow, bent, blunt hooks (uncini) Transverse rows of ventral papillae on segments 17–20–27–32 Abdominal dorsal cirri chopper-shaped Dorsal forked setae, a long intermediate cirrus Ventral ramus bilobed, with fine serrulate setae and a small conical ventral cirrus Spear-shaped spines and special glands absent Gills from the 5th setigerous segment, broadly lanceolate

var. *persica* Fauvel (Fig 156, *a–d*)

Gills begin on the 7th setigerous segment, instead of the 5th Intermediate cirrus much longer than the ventral ramus 25 thoracic segments with vertical rows of genuine hooks with bent, blunt tip and guard, and 2–3

Fig 156—*Aricia cuvieri* Aud & M-Edw, var, *persica* Fauvel *a*, abdominal foot  $\times 40$ , *b*, *c*, *d*, uncini, front and side view  $\times 150$

intermediate segments About 10 foot-papillae on the mid-thoracic segments Ventral papillae present from 23rd to 31st thoracic segments, in crowded rows of 10–11 on each side, nearly meeting in the middle In the abdominal region, the gills are long The intermediate cirrus (*intercirrus*) is about  $1\frac{1}{2}$  times as long as the ven-

tral ramus, whilst in typical *A. cuvieri* it is shorter, or at most, of the same length

*Occurrence* Persian Gulf

*Distribution* Of typical form, Atlantic Ocean, Mediterranean Sea, North Sea

292. *Aricia nuda* Moore (Fig. 157, a-d).

*Aricia nuda*, Moore, 1911, p 311 Eising 1914, p 345 Fauvel, 1932, p 162, fig 25

Body large Prostomium small, conical Thoracic setigerous segments 15 Gills begin on the 5th setigerous segment, the posterior ones are very long and slender

Fig 157 —*Aricia nuda* Moore a, 26th foot  $\times 30$ , b, 28th foot  $\times 30$ , c, subuluncinus  $\times 300$ , d, hastate spine  $\times 120$

Ventral thoracic feet with a fringe of foot papillae and vertical rows of *subuluncini* [genuine hooks (*uncini*) absent], and capillary setae From the 12th to the 15th setigerous segment 4–5 very large spear-headed spines in

each foot Ventral papillae (*subpodiale*) absent In the abdominal feet, capillary setae and forked setae Intermediate cirrus absent

*Occurrence* Off Akyab, Burma, 34 fms

*Distribution* California, Burma

293 *Aricia exarmata* Fauvel (Fig 158, *a—d*, Fig 159, *a—e*)

*Aricia exarmata*, Fauvel, 1932, p 163, figs 26—27

Body of very large size, depressed, enlarged in the thoracic region, semi-cylindrical in the abdominal region

Fig 158 —*Aricia exarmata* Fauvel *a, b*, thoracic foot, anterior and posterior view  $\times 11$ , *c, d*, abdominal feet  $\times 11$ .

Prostomium rather small, blunt, conical, without eyes Thoracic setigerous segments 15—16 (the 16th often smaller, intermediate) Gills begin in the 5th setigerous segment The anterior ones are triangular, lanceolate,

the abdominal ones long and narrow. Dorsal ramus with an asymmetrical chopper-shaped dorsal cirrus with pointed tip, a bundle of camberated capillary setae. Ventral ramus a flattened vertical pad, with a narrow elongated lamella bearing a fringe of about 12–15 long conical papillae, several vertical rows of bent *subuluncini* and long serrated capillary setae. *Genuine hooks (uncini) and spear-shaped spines absent*. Ventral papillae (*subpodiale*)

Fig 159—*Aricia exarmata* Fauvel a, b and c, parts of camberated setae  $\times 500$ , d, forked seta  $\times 520$ , e, subuluncinus  $\times 150$

absent. In the abdominal region, a long dorsal cirrus faintly cultiform, a bundle of long slender, forked, serrated setae. Intermediate cirrus (*inter-cirrus*) absent. Ventral ramus erect, bilobed, with an aciculum and a few slender capillary setae. Ventral cirrus reduced to a small subulate knob. Proboscis with membranaceous lobes encircling the mouth. A dorsal three-lobed sense-

Differs from *A. nuda* chiefly in the absence of large spear-headed spines.

*Length* Thorax 20 mm long, 9–10 mm broad and 4–5 mm thick

*Occurrence* Bay of Bengal, 133 fms (brown mud), a large number of specimens, all incomplete behind

### Genus SCOLOPLOS Blainville

Prostomium conical, a pair of erect lanceolate gills on all segments except a few anterior ones. Thoracic feet with an erect dorsal cirrus and a bundle of serrated capillary setae. Ventral ramus pad-like, with vertical rows of capillary setae mixed with hooks, or without them. One to three foot papillae, or none. Ventral papillae usually absent. In the abdomen, an erect dorsal cirrus, capillary setae and forked setae. Intermediate cirrus (*inter-cirrus*) absent. Ventral ramus bilobed, with capillary setae. Ventral cirrus often absent.

#### *Key to the species of Scoloplos.*

294 *Scoloplos marsupialis* Southern (Fig 160, *d–g*).

*Scoloplos marsupialis*, Southern, 1921, p 632, pl XXVII, fig 19  
Gravely, 1927, p 22, pl IX, fig 11 Fauvel, 1932, p 165

Body flattened in front. Prostomium conical, composed of two rings. 17–19 thoracic segments. Short ventral hooks and capillary setae on the 8–9 anterior feet. Gills begin about 13th–15th foot. From about 18th foot a pocket-shaped, large, thin membrane behind and beneath the ventral cirrus. In the abdominal region, an erect dorsal cirrus, a bundle of capillary serrated setae, ventral ramus bilobed, with fine capillary setae. A small rounded lateral organ between the two rami.

*Length* 50 mm 210 segments

*Occurrence* Chilka Lake, Manikpatna Island, Gulf of Mannar, Krusadai Island, in sand and mud, Tuticorin Beach,

295. *Scoloplos kerguelensis* McIntosh. (Fig. 160, a-c)

*Scoloplos kerguelensis*, McIntosh, 1885, p 355, pl XLIII, figs 6-8, pl XXIIA, fig 19 Willey, 1902, p 275 Eising 1914, p 378 Augener, 1914, p 26 Fauvel, 1932, p 165

Piostomium large, conical but rather blunt Anterior region spindle-shaped, not quite flattened, of 12-19 segments, with only long serrated bristles, devoid of thora-

Fig 160—*Scoloplos kerguelensis* McIntosh a, anterior part, dorsal view, enlarged, b, 20th foot  $\times 31$ , c, 8th foot  $\times 31$  (after McIntosh) *Sc marsupialis* Southern d, short hook from 6th foot  $\times 870$ , e, 4th right foot  $\times 78$ , f, anterior end, ventral view  $\times 44$ , g, 30th right foot, with pouch  $\times 54$ , (after Southern)

cic hooks, foot and ventral papillae The two lamii close to each other, without any well marked setigerous lobe, except in the 3-6 last thoracic segments, which have a very small conical dorsal cirrus and the ventral pad of which bears a very small, inconspicuous median point, which can hardly be considered as a foot-papilla Gills begin on the 20th, 21st, or 22nd setigerous segment, usual-

ly on the 21st, they are triangular, broad and short. The pygidium bears two long, filiform, anal cirri.

*Length.* 25–120 mm by 1–2 mm

*Colour.* Red, in life.

*Occurrence.* Vizagapatam

*Distribution.* Antarctic Ocean, Kerguelen, Falkland Islands, Australia, India.

*Remarks.* Eising (1914, p. 378) considers it to be synonymous with *Sc. armiger* Muller, but this is open to doubt.

296. *Scoloplos chevalieri* (Fauvel) (Fig 161, a–f).

*Aricia chevalieri*, Fauvel, 1901, p. 83, figs 22–28, 1907, p. 18.

Gravier, 1906, p. 167, pl. II, figs 193, 195

*Scoloplos chevalieri*, Eising, 1914, p. 418. Fauvel, 1930, p. 35

Body long, slender. Prostomium sharp pointed. A pair of nuchal organs. 20–27 thoracic segments, each with a dorsal cirrus and slender serrated capillary setae. 4–5 vertical rows of short, brown, blunt, sigmoid hooks mixed

Fig 161—*Scoloplos chevalieri* (Fauvel) a, anterior part  $\times 20$ , b, c, feet  $\times 40$ , d, hook from the anterior segments  $\times 350$ , e, f, parts of capillary bristles, front and dorsal views  $\times 350$

with 2–3 capillary setae. *Podiale and ventral papillae absent.* Lanceolate gills begin on the 7th segment. In the posterior part, gills longer than the broad foliaceous cirrus, dorsal capillary setae and 2–3 forked setae, a short ventral process with a stout blunt aciculum and capillary setae. There is no intermediate cirrus. Lateral organs. Two pairs of anal cirri.

*Length* 50–60 mm. by 1–2 mm

*Occurrence* Gulf of Mannar, Kiusadai and Shingle Islands, Krusadai Lagoon, in muddy sand

*Distribution.* Indian Ocean, Red Sea, Atlantic Ocean (Casamance River)

297 *Scoloplos latus* (Chamberlin) (Fig 162, a–e)

*Branchethus latus*, Chamberlin, 1919, p 358, pl LXIV, figs 7–11, pl LXV, figs 1–2

*Scoloplos latus*, Fauvel, 1932, p 167, fig 28, a–e

Body of large size, much depressed in the anterior part, semi-cylindrical in the middle and posteriorly, ventral side convex. Prostomium small, conical, blunt. Two small, rounded, nuchal organs. Peristomium achae-

Fig 162—*Scoloplos latus* (Chamberlin) a, anterior part, dorsal view  $\times 5$ , b, cross section of the 15th setigerous segment  $\times 6$ , c, 38rd foot with 6 gill filaments  $\times 7$ , d, 58th foot  $\times 20$ , e, ventral hook from the 13th foot  $\times 117$

tous Thorax of 17–18 segments. Dorsal ramus with a conical dorsal cirrus, a short setigerous lobe with a bundle of serrate capillary setae. Ventral ramus a transverse compressed pad with camerated capillary setae, stout bent hooks and a single conical foot-papilla, inserted back-

wards in the middle of the foot. Ventral papillae (*subpodiale*) absent. In the abdominal region an erect dorsal cirrus, an aciculum and a bundle of slender capillary setae. Intermediate cirrus (*intercirrus*) absent. Ventral ramus erect, divided into two unequal lobes, one short and blunt, the other cirriform and tapering, an aciculum, a few capillary setae. Ventral cirrus absent. Gills begin on the 5th setigerous segment. The first few gills are simple, the next few are bifid, and from the 16th foot they have 5–9 long, simple, filaments arising from a short transverse base separated from the foot. In the abdominal region, these long gill-filaments bend backwards, overlap and completely cover the dorsum. Dorsal sense organs, from the 16th–17th segment, they consist of two small elongated pads in the middle of each segment.

*Breadth.* Of thorax 10 mm

*Colour* greyish, colourless in spirit

*Occurrence* Off Akyab, Burma, 250 fms.

*Distribution.* Pacific Ocean, off Panama, Bay of Bengal

#### Genus NAINEREIS Blainville.

*Theodisca* Muller, *Naidoneis* Malmgren, *Anthostoma* Schmarda.

Prostomium rounded. Two eyes. A pair of erect lanceolate gills on each segment, except on a few anterior ones. Thoracic feet with an erect dorsal cirrus and a bundle of serrated capillary setae and forked setae. Ventral ramus pad-like, with a foot papilla and several rows of hooks and *subuluncini*. *No ventral rows of papillae*. In the abdomen, an erect dorsal cirrus, capillary setae and forked setae. *No intermediate cirrus*. *No ventral cirrus*. Ventral ramus bilobed, with capillary setae. Dorsal sense organs.

#### 293. *Nainereis laevigata* (Grube). (Fig 163, a–l)

*Nainereis laevigata*, Fauvel, 1927a, p 22, fig 7, a–l

*Aricia laevigata*, Saint-Joseph, 1898, p 301

*Theodisca hexaphyllum*, McIntosh, 1905, p 63

*Scoloplos hexaphyllum*, Augener, 1926, p 462

Body flattened anteriorly, rounded posteriorly. Proboscis with large palmate lobes. 15–31 thoracic feet, gills

begin from 4th—11th setigerous segment, long, slender Dorsal cirrus knife-like Dorsal capillary setae ctenate, forked setae with unequal, short, ciliated limbs, subulate acicula Ventral ramus semi-circular, pad-like, with an upper papilla, short yellow setae with a long, narrow, denticulate point (*subuluncini*) and true hooks In the posterior region, a dorsal cultriform cirrus, a bundle of

Fig 163—*Nainereis laevigata* (Grube) a, anterior part, proboscis extended  $\times 5$ , b, pygidium  $\times 5$ , c, d, e, anterior, middle and hind feet  $\times 22$ , f, hook  $\times 330$ , g, h, i, subuluncini, more or less worn  $\times 330$ , k, ventral aciculum  $\times 247$ , l, forked seta  $\times 330$

capillary setae, 1–2 forked setae Ventral ramus with two languets, long capillary setae and 3–5 stout acicula No ventral cirrus Anus dorsal Four anal cirri Statocysts on segments 1–23

*Length* 120–250 mm by 4–5 mm

*Colour* in life, pink, red or brownish

*Occurrence* Ceylon, in sand at low water or under stones

*Distribution* Japan, Indochina, Persian Gulf, Atlantic Ocean, Mediterranean Sea

#### Family SPIONIDAE Sars

Body vermiform, not clearly divided into distinct regions Prostomium without tentacles, sometimes with lateral peaks Eyes present Two very long tentacle-like

palps. Proboscis unarmed    Parapodia biamous    Dorsal and ventral cirri foliaceous    Dorsal gills simple (rarely pinnate) on a number of segments    Simple capillary setae and hooded hooks

*Key to the genera of SPIONIDAE*

**Genus NERINE Johnston**

Prostomium without frontal peaks, with one occipital, tentacle-like, keel    Gills from the second setigerous segment almost to the last segments    Dorsal lamella more or less joined to the gill in the anterior segments, an elongated ventral lamella    In the anterior region, only dorsal and ventral capillary setae, more posteriorly, hooded hooks in both rami    An anal cup

**299. *Nerine cirratulus* Delle Chiaje (Fig 164, g—n)**

*Nerine cirratulus*, Fauvel, 1927a, p 36, fig 11, g—n, (Synonymy)

Prostomium sharply conical, with a posterior occipital peak reaching to the 2nd—3rd segment    Four small eyes    Long slender palps    Gills from the second setigerous segment, absent only on a few last segments    Dorsal lamellae long, joined to the gills on the greater part of their length in the anterior region, but less in the posterior region    Ventral lamellae narrow, bilobed in the posterior part    Hooded hooks bidentate    A large anal cup

*Length* 50—80 mm by 2—3 mm

*Colour* in life, blueish-green

**Occurrence** Vizagapatam Channel Only the anterior part of a small specimen, which appears to belong to this species, was obtained

Fig 164—*Nerine cirratulus* (Delle Chiaje) g, anterior part enlarged, h, pygidium, i, 10th foot  $\times 24$ , k, 45th foot  $\times 24$ , l, 85th foot  $\times 24$ , m, capillary bristle  $\times 320$ , n, ventral hooded hook  $\times 320$   
*Prionospio cirrifera* Wiren (the top three figures), k, anterior part, enlarged, l, head, side view  $\times 32$ , m, first foot  $\times 48$

**Distribution** Atlantic Ocean, Mediterranean Sea

### Genus SCOLELEPIS Blainville

Prostomium with two frontal peaks, ending posteriorly in a crest (*carina*) Two long thick palps Gills from the first setigerous segment to the last ones Dorsal lamellae partly joined to the gills Ventral lamellae not notched Hooded hooks only on the posterior ventral ramus always absent on the dorsal ramus Anal cirri

#### 300. *Scolecopsis indica* Fauvel (Fig 165, g—m)

*Scolecopsis indica* (sic), Fauvel, 1928, p 93, fig 2, g—m, 1930a, p 35, fig 7, g—m, 1932, p 170

Body long, slightly broader and flattened anteriorly, filiform behind Prostomium shield-shaped, with two frontal peaks well marked and laterally inserted The prostomium ends posteriorly in a pointed keel extending back to the second setigerous segment, but not raised into an occipital tentacle Two irregular clusters of very small

and numerous eye-spots. Two long and stout, spirally curling palps. Gills beginning on the first setigerous segment. In the anterior region, the long cirriform gills cross over the back. Dorsal lamella erect, lanceolate, attached to the outer border of the gill only at its base. Ventral lamella rounded or oval, slightly mucronate, not notched, posteriorly it is reduced gradually to a decreasing crescent. Dorsal capillary setae neither winged nor dotted. Ventral setae similar but shorter and somewhat

Fig 165—*Laonice cirrata* Sars *a*, anterior part, enlarged, *b*, 12th foot  $\times 16$ , *c*, 22nd foot  $\times 16$ , *d*, 40th foot  $\times 16$ , *e*, hooded hook  $\times 320$ . *Scololepis indica* Fauvel *g*, head  $\times 6$ , *h*, 10th foot  $\times 32$ , *i*, 73rd foot  $\times 32$ , *l*, pygidium, *l*, ventral hook from the last segments  $\times 320$ , *m*, posterior ventral hook  $\times 320$

dotted, with a bundle of 5–6 short, larger, curved ones with a tapering bent tip. Hooded ventral hooks bidentate, 2 to 6 in each ramus, from about the 70th setigerous segment. Dorsal hooks absent. In the last segments, gills short, no more marked lamellae, long and slender capillary setae, in the ventral ramus, 1–2 curved setae, 5–6 hooks and 1–2 long slender setae. Pygidium bearing 4 short finger-shaped cirri. Anus terminal.

*Length.* 60 mm, or more, by 1 to 1.5 mm.

*Colour:* in life pink.

*Occurrence.* Vizagapatam; Gulf of Mannar; Krusadai Island.

Genus **LAONICE** Malmgren

Prostomium rounded, without frontal peaks, ending posteriorly in a raised occipital tentacle Two eyes Palps large Gills beginning at the second setigerous segment and existing only in the anterior part of the body The dorsal lamella is not attached along the gill Ventral lamella not notched Genital pouches present In the anterior region only dorsal and ventral capillary setae, more posteriorly hooded hooks on the ventral ramus only Anal cirri.

301. *Laonice cirrata* Sars (Fig 165, *a-e*).

*Laonice cirrata*, Soderstrom, 1920, p 220, fig 128 Fauvel, 1927a, p 38, fig 12, *a-e*

*Aonides cirrata*, Fauvel, 1914b, p 220, pl XX, figs 4-9

*Spionides japonicus*, Moore, 1907, p 204

A long dorsal crest (sense organ) on the first 28-30 segments Gills 35-45 pairs only, long, cirriform, folded on the back, separate from the dorsal lamella all along Dorsal lamellae large, auriculate in the branchiate segments, smaller, triangular and ovate in the succeeding ones Ventral lamellae oval, rounded in the succeeding segments From about the 25th foot, in mature specimens, pigeon-nest shaped genital pouches between the lamellae Ventral hooded hooks bidentate from about the 40th-50th foot.

*Length.* 90-120 mm by 3-5 mm

*Colour.* yellowish, darker behind

*Occurrence:* Off Puri, Orissa

*Distribution* Japan, India, Atlantic Ocean, Mediterranean Sea, Arctic Seas

Genus **POLYDORA** Bose.

Prostomium blunt or notched in front, ending posteriorly in a crest Gills begin beyond the 6th-9th foot, rarely on the 2nd *Fifth setigerous segment highly modified, with peculiar stout dorsal bristles* Dorsal and ventral capillary bristles, ventral bidentate hooded hooks from the 7th-8th foot An anal cup, simple or lobed

*Key to the species of Polydora*

- 1 Gills begin on the 2nd setigerous segment

Subgenus *Boccardia*

- Gills begin after the 6th setigerous segment . . .

### Subgenus CARAZZIA Mesnil

#### 302 *Polydora (Carazzia) antennata* Claparède (Fig 166, *i-m*)

*Polydora antennata*, Fauvel, 1927a, p 56, fig 19, *i-m*, (Synonymy), 1930a, p 36, 1932, p 172

*Carazzia antennata*, Mesnil, 1896, p 227, pl XIV, figs 22-25

Prostomium with two tentacle-like lobes in front and a small erect occipital tentacle Four eyes. On the first setigerous segment well marked dorsal and ventral lamellae, ventral capillary setae but *no dorsal ones* Large gills beginning on the 7th foot Peculiar setae of the 5th setigerous segment, pointed and hollowed at the shoe-shaped tip, arranged in the form of a horse-shoe with lanceolate setae Ventral hooded hooks from the 8th foot No peculiar posterior setae Anal cup notched on dorsal and ventral borders.

*Length* 20-30 mm.

*Colour.* uniformly yellowish.

## Occurrence Gulf of Mannar, Krusadai Island

Fig 166—*Polydora (Polydora) armata* Langerhans a, anterior part, b, 7th foot  $\times 32$ , c, dorsal posterior bristles  $\times 240$ , d, stout hooks from the 5th segment  $\times 176$ , e, pygidium  $\times 36$  P (*Carazzia*) *antennata* Claparède f, head  $\times 13$ , g, hooded hook  $\times 240$ , h, stout hook from the 5th segment  $\times 192$ , i, 5th foot  $\times 36$  P (*Polydora*) *ciliata* Johnston (Figs on right-hand side), j, anterior part, enlarged, k,  $\times 4$ , l, first foot, m, anal cup, n, lancet-shaped seta from the 5th segment  $\times 320$ , o, stout hook of the 5th segment  $\times 320$ , p, hooded hook  $\times 320$

**Distribution** India, Arabian Sea, Atlantic Ocean, Mediterranean Sea.

303 *Polydora (Carazzia) kempfi* Southern (Fig 167, a—c).

*Polydora (Carazzia) kempfi*, Southern, 1921, p 636, pl 28, figs 20

Prostomium rather small and broad, bilobed, without caruncular prolongation, but with a large erect occipital tentacle Four black eyes On the first setigerous segment, no dorsal setae, a stumpy round papilla, a ventral lobe with a row of slender capillary setae No ventral lamella. On the 2nd to 6th segment dorsal and ventral bundles of capillary setae, the dorsal long, slender, the ventral flattened A dorsal rounded lamella The 5th setigerous segment is less modified than in any other species, with dorsal superior setae long and narrow capillaries; the inferior dorsal setae consist of two rows of modified setae, the anterior setae are bi-limbate capillaries,

short, with broad wings, rapidly tapering, the posterior row consists of rather stout hooks with curved tips. The ventral setae are lance-shaped. The gills appear on the 7th segment, they are quite free from the dorsal lamellae, there are only 10–11 pairs of them. Ventral hooks appear on the 8th setigerous segment, they are not accom-

Fig 167 —*Polydora (carazzia) kempi* Southern a, anterior end, dorsal view X50, b, lower dorsal setae from the 5th foot X500, c, ventral hook from the 8th foot X720 (after Southern) *P. panied by any capillary setae and resemble those of *P. antennata*. Posterior region unknown.

**Occurrence** In a canal at Chingrighatta, Calcutta Salt Lakes.

#### Subgenus POLYDORA Bose

304 *Polydora (Polydora) hornelli* Willey (Fig 167, d–f).

*Polydora hornelli*, Willey, 1905, p. 286, pl. V, fig. 117. Southern, 1921, p. 634, pl. 28, figs. 21, AD.

Prostomium slightly notched, with two round lobes, it is prolonged backwards over the first 2–3 segments.

*No eyes* Tentacles stout, long On the first setigerous segment a small dorsal and a small ventral lamella *No dorsal setae*. A bundle of ventral capillary setae 2nd to 6th segments with two rows of setae On the 5th setigerous segment an oblique row of long stout acicular, spoon-shaped hooks, *with a neck and a closely applied tooth*, accompanied by delicate spatulate setae Gills and ventral hooks appear on the 7th setigerous segment and continue to the end Last segments and pygidium unknown

*Length* 31 mm. and more, by 15 mm

*Colourless*.

*Occurrence* Chilka Lake, Gulf of Mannar In crevices of oyster shells

305. *Polydora* (*Polydora*) *ciliata* Johnston (Fig 166, 1-p).

*Polydora ciliata*, Fauvel, 1927a, p 49, fig 16, 1-p, (Synonymy), 1932, p 172

Prostomium faintly notched in front, prolonged backwards over the second segment Four eyes On the first setigerous segment, dorsal and ventral lamellae, *no dorsal setae*, ventral capillary setae 2nd to 6th segments with both dorsal and ventral capillaries On the 5th setigerous, stout hooks with a lateral spine, and lanceolate setae Ventral bidentate hooks from the 7th setigerous segment Gills from the 7th to the 10th penultimate segments Anal cup notched dorsally.

*Length* 20-30 mm. by 1 mm.

*Colour* yellowish, both extremities and anal cup darker.

*Occurrence* Chandipore, Orissa Coast

*Distribution* Australia, Indo-China, India, Red Sea, Atlantic Ocean, Mediterranean Sea, Falkland Islands

306. *Polydora* (*Polydora*) *coeca* Oersted (Fig 168, a-k)

*Polydora coeca*, Fauvel, 1927a, p 52, fig 18, a-k, Gravelly, 1927, p 23

Prostomium deeply notched, prolonged backwards over the first two segments Generally eye-less Tentacles long and slender On the first setiger, a small dorsal and a small ventral lamella, *dorsal and ventral capillary setae* On the 5th setigerous segment, stout spoon-shaped hooks, without lateral tooth, accompanied by lancet-

shaped setae. Ventral bidentate hooded hooks from the 7th setigerous segment. In the posterior region, the anterior dorsal winged setae are replaced by 3—4 small, straight awl-shaped setae. there are no bundles of slender

Fig 168—*Polydora* (*Polydora*) *coeca* (Oersted) *a*, anterior part, *b*, posterior foot  $\times 40$ , *c*, foot from mid-body  $\times 40$ , *d*, *e*, hooks from the 5th setigerous segment  $\times 320$ , *f*, hooded hook  $\times 320$ , *g*, winged seta  $\times 320$ , *h*, lancet shaped seta from the 5th segment  $\times 320$ , *i*, *k*, posterior bodkin setae  $\times 320$  *P* (*Polydora*) *flava* Claparède *n*, anterior part  $\times 20$ , *o*, first setigerous segment  $\times 36$ , *p*, 8th-setigerous segment  $\times 48$ , *q*, *r*, special hooks from the 5th segment  $\times 320$ , *s*, hooded hook  $\times 320$ , *t*, bundle of slender posterior setae  $\times 320$ , *u*, lancet-shaped seta from the 5th segment  $\times 320$

*setae* Gills begin on the 8th setigerous segment and are absent on the posterior half, or third, of the body. A deeply notched anal cup.

*Length* 20—40 mm by 1 mm

*Colour.* yellowish. Boring in shells and coral rocks.

*Occurrence* Gulf of Mannar, Krusadai and Shingle Islands. Amongst sponges.

*Distribution* Indian Ocean, Atlantic Ocean, Mediterranean Sea, Arctic Seas.

307 *Polydora (Polydora) armata* Langehans (Fig 166, *a-e*)

*Polydora armata*, Fauvel, 1927a, p 55, fig 19, *a-e*, Willey and Watson, 1905, p 325

Prostomium notched, with two rounded horns, prolonged backwards on the first two segments. Generally eye-less. Tentacles rather long. On the first setigerous segment dorsal and ventral lamellae, *dorsal and ventral setae*. On the 5th setigerous segment 2-3 stout, peculiar setae with blunt hooks, two lateral processes connected by a transverse ridge, *no lance-shaped setae*. Ventral, bidentate, hooded hooks from the 7th setigerous segment backwards. *On the 8-12 last segments, on the dorsal ramus, a conical bundle of 8-18 stout brown acicular setae*. Only 5-7 pairs of gills beginning on the 7th setigerous segment. Anal cup with a dorsal, and sometimes, a ventral notch.

*Length* 4-5 mm.

*Colourless*. Burrows in shells and calcareous Algae.

*Occurrence*: Ceylon, commensal with the sponge *Aulospongia tubulatus*.

*Distribution*: India, Atlantic Ocean (Madeira), Mediterranean Sea, English Channel.

308. *Polydora (Polydora) flava* Claparède (Fig 168, *n-u*).

*Polydora flava*, Fauvel, 1927a, p 52, fig 17, *m-n*, Augener, 1926, p 461

Prostomium notched into two sharp horns, prolonged backwards to the first two segments. No eyes. Tentacles long and slender. On the first setigerous segment, dorsal and ventral lamellae, *dorsal and ventral setae*. On the 5th setigerous segment stout spoon-shaped hooks without lateral tooth, accompanied by lance-shaped setae. Ventral bidentate hooded hooks from the 7th setigerous segment backwards. From the 8th setigerous segment backwards a dorsal bundle of very numerous, very slender, needle-like setae. Gills from the 8th setigerous segment (sometimes 7th or 9th), absent on the posterior third of the body. A broad anal cup with four notches.

*Length* 20-45 mm

*Colour* yellowish.

*Occurrence* Ceylon. In small muddy tubes on old shells and in rock clefts.

*Distribution* Japan, Sumatra, India, Atlantic Ocean, Mediterranean Sea, English Channel

Genus **POLYDORELLA** Augener

Closely allied to *Polydora* Setae nearly similar, but modified setae on the 4th setigerous segment, instead of the 5th Pygidium not cup-like Schizogamous

309. ***Polydorella prolifera*** Augener (Fig 169, a—g)

*Polydorella prolifera*, Augener, 1914, p 16, pl I, fig 3 Fauvel, 1930a, p 36, fig 8

Post-larval Chaetopterid, Gravely, 1927, p 24, pl IX, figs 12—14

Prostomium rounded, bilobed, with two eyes Long, stout, cylindrical palps On the first setigerous segment a dorsal and a ventral bundle of slender capillary setae Up to the 6th setigerous segment, only capillary setae, with

Fig 169—*Polydorella prolifera* Augener a, anterior part, dorsal view (tentacles fallen off)  $\times 45$ , b, c, d, peculiar setae from the 4th setigerous segment, side and front views  $\times 550$ , e, f, spoon-shaped setae from the 4th segment  $\times 550$ , g, hooded hook from the 7th foot *Dodecaceria fistulicola* Ehlers h, anterior spoon-shaped hook  $\times 550$ , i, posterior hook  $\times 550$

the exception of the 4th bearing the following modified setae (1) a row of 3—6 large asymmetrical bristles with a denticulate or wrinkled crest and a blunt hook, (2) an inferior row of 3—6 smaller setae slightly enlarged at the tip, which is spoon-shaped, with a more or less blunt lateral process, (3) a few ventral, slender capillary setae

About the 6th—7th setigerous segment appear the ventral hooks with a double curvatuie and a hooked tip with a very long and slender tooth running nearly parallel to the vertex which is provided with a broad hood. Gills, according to Augener, are only to be found on the 6th setigerous segment in a few specimens they are simple filaments. 3—4 achaetous posterior segments. A conical pygidium, faintly notched, without cup or funnel. Anus terminal. "Proliferation takes place by the formation of the head of a daughter worm and a new tail for the parent between the ninth and tenth segments."

*Occurrence* Gulf of Mannar "Found in abundance, each in a minute mud-covered tube adherent throughout its length to the surface of a sponge" (Gravelly)

*Distribution* Australia, Gulf of Mannar.

### Genus PRIONOSPPIO Malmgren.

Prostomium short, rounded, frontal peaks and occipital tentacles absent. Eyes present. Long deciduous palps. Gills 3—11 pairs, often pinnate. Dorsal lamellae not bound to the gills. Ventral lamellae entire. Sometimes genital pouches present. Dorsal and ventral capillary setae. Dorsal and ventral pluridentate hooded hooks.

#### *Key to the species of Prionospio.*

*Paraprionospio pinnata*, Caullery, 1915, p 356, fig 2

*Paraprionospio tribranchiata*, Berkeley, 1927, p 11, pl I, figs 2—3

*Prionospio africana*, Augener, 1918, p 402, pl VI, figs 162—163

(?) *Prionospio alata*, Moore, 1923, p 185

Prostomium enclosed between two upturned membranaceous wings 3—4 pairs of pinnate gills beginning on the first setigerous segment Gills of the second pair generally smaller As the gills are very easily lost the differences in size are to be ascribed to regeneration A well marked transverse crest, or ridge, arises between the first two setigerous segments there are no ridges posteriorly

*Occurrence:* Off Akyab, Burma, 250 fms, Madras, Vizagapatam, Mormugao Bay, Maldive Archipelago

*Distribution:* Pacific Ocean, Indian Ocean, Atlantic Ocean.

311. *Prionospio cirrifer* Wren (Fig 164, k—m)

*Prionospio cirrifer*, Söderstrom, 1920, p 237, figs 131—146

Fauvel, 1927a, p 62, fig 21 (Synonymy), 1932, p 174

(?) *Prionospio multibranchiata*, Berkeley, 1927, p 10, pl I, fig 1

Prostomium rounded in front, ending behind in a crest extending to the 2nd—3rd setigerous segments There are no membranaceous prostomial wings Gills 6—13 pairs, all simple, beginning at the second setigerous segment Anterior dorsal lamellae very large, and from 3rd to 6th feet sharp, pointed In mature specimens, genital pouches begin about 5th—7th setigerous segments Ventral lamellae oval or rounded

*Length.* 30 mm

*Colour:* yellowish-white.

*Occurrence:* Vizagapatam.

*Distribution:* Vancouver (?), India, Atlantic Ocean, Arctic Seas

312. *Prionospio polybranchiata* Fauvel. (Fig 170, a—g)

*Prionospio polybranchiata*, Fauvel, 1929, p 184, 1930a, p 39, fig 10, a—g

*Prionospio multibranchiata*, Fauvel, (non Berkeley) 1928, p 94, fig 3, a—g

Anterior region flattened, enlarged, tapering forwards, posterior region cylindrical Above 40 segments. Prostomium elongate, anterior border rounded, ending posteriorly in a blunt ridge on the edge of the third setigerous segment. No eyes apparent Two very long twisted palps reaching backwards to the 26th—27th segment. On the first setigerous segment the dorsal setae are reduced

ed to a small conical (achaealous?) nipple and a small ventral lamella and setae. Gills from the second setigerous segment, the first five pairs filiform, not pinnate, very long, reaching backwards to the 8th–10th setigerous segment, the following ones foliaceous, sub-triangular, elongated.

Fig 170—*Prionospio polybranchiata* Fauvel a, prostomium, enlarged, b, 4th gill and foot  $\times 24$ , c, 11th foot  $\times 48$ , d, 29th foot  $\times 48$ , e, 40th foot  $\times 48$ , f, hook  $\times 360$ , g, posterior hook  $\times 360$  *Stylarioides eruca* (Claparède), var *indica* Fauvel, h, foot papilla  $\times 112$ , i, k, l, three kinds of ventral setae from the same foot  $\times 112$

gate, bent on the back and partly attached to the dorsal lamella their size then decreases but they still exist on the 40th setigerous segment. Dorsal lamellae triangular, erect, rather large and free on the first 5 setigerous segments, after which their size decreases and they become more oval or subtriangular, then obsolete. In the anterior region the dorsal ridges are reduced to a very slender transverse wrinkle on each segment. Anteriorly, both dorsal and ventral setae are capillary. Ventral pluri-dentate hooded hooks from the 22nd setigerous segment. At the 40th they are still absent in the dorsal ramus. No genital pouches. Pygidium unknown.

*Length*: more than 11 mm by 2 mm.

*Discoloured* in spirit.

*Occurrence*: Gulf of Mannar

**313. *Prionospio krusadensis* Fauvel (Fig 171, a-e)**

*Prionospio krusadensis*, Fauvel, 1929, p 182, fig 2, 1930, p 38, fig 9

Body slender, filiform, slightly enlarged anteriorly. Prostomium, long, conical, with a blunt ridge running to the 2nd segment. A low lateral fold, which does not form a marked wing, on each side of the prostomium.

Fig 171 —*Prionospio krusadensis* Fauvel a b, c, 6th, 15th, 20th feet  $\times 120$ , d, bristle from the 10th setigerous segment  $\times 400$ , e, ventral hook from the 18th setigerous segment

Two clusters of 4–5 small eyes. First setigerous segment with both rami obsolete and only dorsal setae (?). Branchiae three pairs, on the second, third and fourth setigerous segments, they are all pinnate, the third pair often smaller. On the anterior segments, the dorsal lamellae are large, oval, or sub-triangular, the 5–6 first ones sub-equal, the 4th often larger. The following lamellae are lower, more rounded or heart-shaped, gradually decreasing in size, but still conspicuous to the end of the body. Ventral lamellae smaller, at first oval, next rounded and

then very small. No noteworthy transverse ridges. In the anterior region dorsal and ventral setae long and capillary. In 3–4 segments, from the 10th setigerous, on the ventral ramus a large golden seta, curved and dotted. From the 17th–18th setigerous segment ventral hooks with 3 teeth above the main fang. Dorsal hooks from the 40th–42nd setigerous segment. *There are no genital pouches.* A median anal cirrus and two very small others.

*Length* about 20 mm by 0.7–0.8 mm

*Colour* yellowish in alcohol

*Occurrence* Gulf of Mannar, Krusadai Island

### Family DISOMIDAE Mesnil

Prostomium with two long tentacle-like palps. Feet buamous (at least in the anterior region). Setae of various kinds. Acicular setae. Dorsal and ventral cirri elongated or frilled. Body not clearly divided into regions.

### Genus DISOMA Oersted

No median frontal tentacle, and nuchal organ without three tentacular lobes. Dorsal cirri fleshy, rounded, with a frilled or smooth border.

#### 314. *Disoma orissae* Fauvel (Fig 172, a–m)

*Disoma orissae*, Fauvel, 1932, p. 174, fig. 29, a–m

Prostomium elongated, slightly notched in front, bulging in the middle and ending behind in a crest reaching to the 2nd setigerous segment. On the raised part, four very small eyes, two dorsal and two lateral, and a small erect, tapering, median tentacle. On each side, at the base of the prostomium, a small projecting nuchal organ. On the first setigerous segment a large lanceolate, subulate, dorsal cirrus and a ventral one directed forwards, a small bundle of capillary setae in front of the dorsal cirrus, and a fan-shaped ventral bundle of much longer setae extending beyond the prostomium. On the 2nd setigerous segment dorsal and ventral cirri, triangular, much smaller than the first ones, and ventral setae of two types: (1) an anterior row of very fine capillary setae and (2) a posterior transverse row of stouter shorter bristles with blunt curved tips. *Dorsal setae absent.* On the 3rd setigerous segment, a large lanceolate, chopper-like, dorsal cirrus, a crescentic tip, a triangular ventral cirrus, smaller than the dorsal one, a small ligule under the ventral cirrus and, in

front of the parapodial lamella, a vertical row of 7 stout yellow acicular setae with blunt bent tips, an anterior row of slender capillary setae and, in front of the cirrus, a diverging fascicle of dorsal capillary setae. In short, the ventral setae of the second foot are shaped like those on the third, but the acicular bristles are smaller, paler and more hyaline. Between the third and fourth foot, a deep triangular notch on each side of the body divides the anterior part from the following region in which the first 6-7 segments are much larger than the others, as a result,

Fig 172—*Disoma orissae* Oersted a  $\times 7$ , b, anterior end, dorsal view  $\times 22$ , c, d, winged bristles from the 6th setigerous segment  $\times 110$ , e, ventral stout bristle from the 2nd segment  $\times 110$ , f, ventral capillary seta from the 2nd segment  $\times 110$ , g, h, stout bristles from the 3rd segment  $\times 110$ , i, capillary seta from the 3rd segment  $\times 110$ , j, k, fine dorsal setae from the 3rd segment  $\times 110$ , l, abdominal papillae  $\times 48$ , m, posterior foot with bodkin and capillary setae  $\times 48$

this region is enlarged and flattened. On the 4th setigerous segment, the first of the enlarged part though smaller than the next, the dorsal and ventral cirri are thick, rounded lamellae, and there is a bundle of dorsal and ventral setae. The condition is the same in the succeeding four segments, but the ventral bristles are large, stout, yellow, set brush-like, as in *Aricia*, and of two kinds (1) stout, doubly curved, nearly sickle-shaped, with a broad wing showing a tendency to split into fine spines, (2) capillary, similar to the dorsal ones. The dorsal setae disappear about the 11th foot. From the 9th segment backwards the dorsal cirri become filiform and the ventral ones are modified about the 12th-13th feet. Beyond the

11th foot long filiform ventral papillae make their appearance, a single one at first under each foot, but increasing to 2, 3, or 5. From the 9th foot backwards, the ventral setae are of two kinds (1) stout, straight, bodkin-shaped, and (2) very slender capillaries.

*Length* about 6 mm by 1 mm. 25 segments, incomplete behind.

Discoloured, in spirit.

*Occurrence* Off Puri, Orissa, 4–4½ fms.

### Family MAGELONIDAE Cunningham and Ramage

Body filiform divided into two regions. Prostomium oval, flattened, without tentacles. Two long papillated palps. A big proboscis. Parapodia biramous. Dorsal and ventral cirri lamelliform. Gills absent. Setae simple capillaries, or hooded hooks. Anal cirri.

### Genus MAGELONA O. F. Muller.

Anterior and posterior region separated by a peculiar segment. Prostomium broadly oval, spatulate. Proboscis globular. Two long palps with sucker papillae.

#### 315 *Magelona* sp. juv.

Monro, 1937, p. 299, fig. 19.

Monro's specimen from the Maldives is a post-larva too young for its attribution to any of the known species of *Magelona*.

*Magelona rosea* Moore has been recorded from the Gulf of Siam, *M. obakensis* Gravier, from the Red Sea, and *M. pacifica* Monro from the Pacific Ocean (Galapagos Islands).

### Family CIRRATULIDAE Carus

Body stout, subcylindrical, tapering at both ends. Prostomium without palps and tentacles. Peristomium ringed. Stout tentacular cirri (palps) inserted on the dorsal side of an anterior segment. Long slender simple gills inserted above the dorsal ramus. Feet biramous, both rami low and far apart. Capillary simple setae and simple acicular hooks. Dorsal and ventral cirri absent.

#### *Key to the genera of CIRRATULIDAE.*

*Timarete anchylochaeta*, Ehlers, 1904, p. 53

(?) *Timarete fecunda*, Kinberg, 1857-1910, p. 64, pl. XXV, fig. 1

Gills from the first setigerous segment. Tentacular cirri inserted in two clusters on the 5th-6th setigerous segments. Capillary setae in every foot. Dorsal and ventral hooks 2-4 in each ramus, rather slender. Distance between point of gill insertion and the dorsal ramus shorter than the distance between both rami. Closely allied to *A. tentaculata*, if not conspecific.

*Length* 100-200 mm. by 4-5 mm

*Colour* deep yellow, or red-brown, or greenish-brown, with red gills, in life.

*Occurrence.* Persian Gulf.

*Distribution* Australia, New Zealand, New Caledonia, Persian Gulf

## Genus CIRRATULUS Lamarck.

Body long, cylindrical. Prostomium conical. First three segments achaetous. Lateral gills from the first setigerous segments to the hind part. Tentacular filaments nearly as slender as the gills and beginning on the same segment. Capillary setae and acicular hooks

### *Key to the genus Cirratulus.*

*Cirratulus filiformis*, Fauvel, 1927a, p 94, fig 33, h-i, 1930a, p 43  
 48 Monro, 1937, p 301

Body long, slender Prostomium pointed, eyeless  
 On the first segment one pair of gills and 1-2 pairs of  
 tentacles, hardly stouter Capillary setae on both dorsal  
 and ventral ramus No hooks

*Length* 30-40 mm by 0.5-1 mm

*Colour* yellowish, or greenish-yellow

*Occurrence.* Gulf of Mannar, Pamban, Maldive  
 Archipelago

In rock clefts and diedgings

*Distribution* Indian Ocean, Persian Gulf, Atlantic  
 Ocean, Mediterranean Sea

320 *Cirratulus chrysoderma* Claparède

*Cirratulus chrysoderma*, Fauvel, 1927a, p 95, 1930, p 43

Body slender Prostomium triangular, eyeless Gills  
 and tentacles begin on the 4th setigerous segment Gills  
 on the anterior half of the body only Only two pairs of  
 tentacles Gills inserted just above the dorsal ramus  
 Only long capillary setae on both ramus No hooks

*Length* 20-70 mm by 0.5-3 mm

*Colour* greenish

*Occurrence* Gulf of Mannar, Pamban

*Distribution* Japan, Malayan Seas, India, Persian  
 Gulf, Mediterranean Sea

321. *Cirratulus dasylophius* Marenzeller.

*Cirratulus dasylophius*, Marenzeller, 1879, p 146, pl VI, fig 6  
 Fauvel, 1911, p 411

(?) *Cirratulus complanatus*, Willey, 1905, p 294

Prostomium triangular, eyeless On the second seti-  
 gerous segment one pair of gills and one pair of tentacu-  
 lar cirri, on the third and fourth segments one pair of  
 gills and numerous tentacles thence one pair of gills only  
 and no tentacles on every segment Capillary setae and  
 hooks in both ramus, with the exception of the first seti-  
 gerous segment, in which hooks are wanting Ventral  
 hooks stouter than the dorsal First dorsal hooks about  
 43rd, ventral hooks from 29th setigerous segment

*Occurrence.* Persian Gulf, Ceylon (?).

*Distribution* Japan, Indian Ocean, Persian Gulf

322. *Cirratulus cirratus* O F Muller (Fig 173, a—g).

*Cirratulus cnratus*, Fauvel, 1927a, p 94, fig 33, a—g, 1919, p 427, 1939 p 346

Body cylindrical, Prostomium blunt-conical, on each side an oblique row of 4—8 large black eyes. Gills and tentacles on the first setigerous segment. The gills persist to the hind part of the body. 2—8 pairs of slightly stouter tentacles. Dorsal and ventral capillary setae on all the feet. Dorsal and ventral acicular setae, with the exception of a number of anterior segments.

*Length.* 30—120 mm by 1.5—3 mm

*Colour.* yellow-orange, red or brown.

*Occurrence.* Persian Gulf. In muddy sand.

*Distribution.* Japan, Indochina, Persian Gulf, Atlantic Ocean, Arctic Ocean and Antarctic Ocean, Keiguelen, Falkland Islands, Cape Horn.

## Genus THARYX Webster and Benedict

Body cylindrical, slender, elongate. Peristomium and the two succeeding segments achaetous. Prostomium conical. Lateral gills on a number of anterior segments. One pair of stout dorsal palps and one pair of gills on the first setigerous segment. Dorsal and ventral rami little remote. Capillary setae only.

323. *Tharyx multifilis* Moore

*Tharyx multifilis*, Moore, 1909, p 267, pl IX, fig 43. Fauvel, 1932, p 179

Prostomium long, sharply conical, eyeless (?). Gills absent on about the last 20 segments. Dorsal setae longer than the ventral ones.

*Occurrence.* Madras.

*Distribution.* San Diego, California; Madras.

## Genus HETEROCIRRUS Grube

Prostomium conical. Two stout dorsal palps and one pair of gills before the first setigerous segment. A number of lateral gills. Capillary setae and hooks.

324. *Heterocirrus typhlops* Willey. (Fig 174, d).

*Heterocirrus typhlops*, Willey, 1905, p 295, pl V, fig 138

"A very small worm, total length 10.5 mm, diameter less than half a millimetre. Capillary non-limbate setae in both fascicles, dorsal and ventral acicular setae com-

mence on the first setigerous segment, they resemble those of *Curatulus*, the ventral acicular setae are two in number, more curved and thicker than the dorsal" "The disposition of such cirriform appendages as remain are inserted laterally over the feet" (Willey).

Fig 174—*Dodecaceria fistulicola* Ehlers a, capillary bristle and anterior hook  $\times 570$ , b, posterior hooks  $\times 570$  (after Ehlers) *Audouinia semicincta* (Ehlers). c, anterior part (after Gravier) *Heterocirrus typhlops* Willey d, anterior part, (after Willey) *Prionospio pinnata* Ehlers e, anterior part, side view (after Caullery)

**Occurrence** Southwest Cheval Paar, Gulf of Mannar. Willey's description and figures hardly agree with *Heterocirrus*.

### Genus DODECACERIA Oersted.

Body stout. Prostomium blunt, generally eyeless. Peristomium achaetous, triannulate, with two stout palps. Tentacular filaments absent. 4–15 pairs of gills. All setae simple. Dorsal and ventral capillary setae. Spoon-shaped hooks on both rami, with the exception of the anterior region.

#### 325. *Dodecaceria fistulicola* Ehlers (Fig 169, h, i, Fig. 174, a, b).

*Dodecaceria fistulicola*, Ehlers, 1901, p 186, pl XXV, figs 5–9  
Fauvel, 1930, p 543, 1935, p 340

*Dodecaceria joubini*, Gravier, 1906, p 156, pl I, figs 183–184

(?) *Dodecaceria opulens*, Gravier, 1909, p 643, pl 17, figs 39–45  
Fauvel, 1930a, p 44

Body flattened posteriorly Prostomium bluntly conical Two stout grooved palps, 5 pairs of large gills and 2—3 other pairs, much more slender Capillary setae Large spoon-shaped hooks with a swelling at the back of the cavity which, seen in profile, looks like a blunt lateral tooth Anterior and dorsal hooks more slender.

*Length:* 15—25 mm

*Colour.* black coloured, or very dark brown

*Occurrence* Pamban, Gulf of Mannar

*Distribution* Coast of Chile, Australia, New Caledonia, Annam, India, Red Sea?

*Remarks* *Dodecaceria fistulicola* Ehlers, *D joubini* Gravier and *D opulens* Gravier are three very closely related species, and may be only varieties Ehlers' denomination has priority

### Family CHAETOPTERIDAE Aud and M-Edw

Body soft, divided into two or three regions Prostomium little conspicuous Mouth terminal, no extrusible proboscis Two or four tentacles (palps and tentacular cirri). Anterior region of a few uniramous segments, middle region, when present, with biramous highly specialised segments, posterior region of numerous biramous segments, all of them similar Dorsal setae capillary or lanceolate In the fourth setigerous segment peculiar stout spines Ventral setae pectinate uncini Tube horny, more or less ringed, translucent, or opaque parchment-like

### Key to the genera of CHAETOPTERIDAE

Genus **CHAETOPTERUS** Cuvier

Body of large size, thick, soft, divided into three distinct regions. Two small filiform palps (tentacles). Anterior region with uniramous feet and oar-shaped setae. Stout modified bristles on the 4th setigerous segment. Middle region of 5 biramous segments, the first with two aliform appendages, the next with dorsal rami cup-shaped and the others paddle-shaped. Ventral rami coalescent, bearing pectinate uncini. Posterior region with dorsal rami unilobed, ventral rami bilobed, uncinigerous. Tube consisting of layers of parchment-like membranes.

n) .

*Chaetopterus variopedatus*, Fauvel, 1927a, p. 77, fig. 26, a-n (Synonymy), 1932, p. 176. Pruvot, 1930, p. 76.

*Chaetopterus cautus*, Marenzeller, 1879, p. 143, pl. VI, fig. 5.

*Chaetopterus appendiculatus* Grube, Willey, 1905, p. 291, pl. V, fig. 126.

Fig 175 — *Chaetopterus variopedatus* (Renier) a, b, dorsal and ventral view, reduced 1/3, c, foot of the 3rd thoracic segment, d, last thoracic foot, e, posterior foot (after Joyeux-Laffine), f, capillary seta of the dorsal ramus of the first segment of the mid-body region (wings)  $\times 47$ , g, h, uncini  $\times 310$ , i, stout bristle from the 4th segment  $\times 23$ , k, thoracic capillary bristle  $\times 60$ , l, m, thoracic lancet-shaped setae  $\times 47$ , n, acicular bristles from the posterior feet  $\times 23$ .

*Chaetopterus longimanus*, Crossland, 1904, p 272, pl XVIII, fig 1-2

*Chaetopterus longipes*, Crossland, 1904, p 277, pl XIX, fig 1-2

The specific characters are mainly those of the genus. It is very doubtful whether there is really more than one species, although many have been described, but the characters used to discriminate them are of very little value. Specimens exhibit a great deal of variation which is probably a result of frequent autotomy, followed by more or less complete regeneration, individual specimens also present an extensive range of variation, for instance, the characters given by Crossland as distinctive of *Ch longimanus* are often met with in *Ch variopedatus* from the Atlantic Ocean and English Channel. *Ch longipes* is only a young form of the same. The number and size of the anterior segments vary to a very large extent, as also the length of the feet.

*Length* 150-250 mm. by 15-25 mm

*Colour* in life, greenish-yellow or whitish-yellow. Median region partly black. Phosphorescent.

*Occurrence* Mergui Archipelago, Ceylon, Maldive Archipelago.

*Distribution* Pacific, Indian and Atlantic Oceans. Cosmopolitan.

### Genus PHYLLOCHAETOPTERUS Grube

Body slender, divided into three regions. Two long tentacles (palps) and two small posterior tentacles. Anterior region with uniramous feet bearing oar-shaped setae. One or more large peculiar spines on the 4th setigerous segment. Middle region with a number of biramous feet, dorsal rami foliaceous, lateral branchial lobes, and ventral rami bilobed. Posterior region with biramous feet, dorsal rami cylindrical, ventral rami uncinigerous. Tube horny, translucent, cylindrical, more or less ringed. Schiziparous reproduction frequent.

#### *Key to the species of Phyllochaetopterus.*

| 2 Glandular cirri on the first segment of the middle region | <i>aciculigerus</i><br>Crossland, p 341. |

- No glandular cirri on the first segment of the middle region *herdmani* Willey, p 342
- 3 A single spine on the 4th segment *socialis* Claparède, p 339
- Several spines on the 4th segment 4
- 4 Large size *gardineri* Crossland, p 341
- Small size *elioti* Crossland, p 340

327. *Phyllochaetopterus socialis* Claparède (Fig 176, a-l)

*Phyllochaetopterus socialis*, Fauvel, 1927a, p 84, fig 30, a-l, 1932, p 177

*Phyllochaetopterus pictus*, Crossland, 1903, p 174, pl XVI, figs 5-9

(?) *Phyllochaetopterus ramosus*, Willey, 1905, p 293, pl V, figs 133-136

Two eyes Anterior region 10-18 and more segments  
Middle region 5-28 segments Posterior region, numerous segments  
On the fourth setigerous segment a single large modified spine, obliquely truncate at the tip Ram

Fig 176 — *Phyllochaetopterus socialis* Claparède a, dorsal view  $\times 4$ , b, head and first segments  $\times 8$ , c, section of mid-body  $\times 20$ , d, hind foot with lancet-shaped bristle  $\times 106$ , e, f, g lancet shaped and knife-shaped bristles of the thoracic feet  $\times 106$ , h-i, stout bristle from the 4th setigerous segment  $\times 62$ , 106, k, uncinus  $\times 390$ , l, tubes  $\times 2$

of the posterior region with one, rarely two, lanceolate setae. Horny tubes ringed, simple or branched.

*Length* 20–40 mm by 1–2 mm

*Colour* yellowish, with brown-reddish spots on the anterior region and tentacles.

*Occurrence* Chandipore, near Balasore, Orissa, Ceylon, Bombay, Arabian Sea, Maldivé Archipelago, Gulf of Oman

*Distribution* Australia; Indian Ocean, Atlantic Ocean, Mediterranean Sea, Falkland Islands

328. *Phyllochaetopterus elioti* Crossland (Fig 177, e–h).

*Phyllochaetopterus elioti*, Crossland, 1903, p. 172, pl. XVI, fig. 1, 3, 8, pl. XVIII, fig. 10–13, Fauvel, 1930a, p. 41

Fig 177—*Phyllochaetopterus gardneri* Crossland a, anterior part, dorsal view  $\times 3$ , b, section of a segment of the 2nd region  $\times 3$ , c, short bristle from the 4th setigerous segment  $\times 47$ , d, clavate dorsal foot from the posterior region  $\times 47$  *Ph. elioti* Crossland e, stout bristle from the 4th setigerous segment  $\times 66$ , f, foot of the posterior region  $\times 66$ , g, head  $\times 6$ , h, side view of the 3rd segment of the middle region  $\times 6$  (after Crossland) *Ph. herdmanni* Willey i, anterior end, k, a branchial segment, l, stout bristle from the 4th foot, m, modified seta from the 3rd foot of an aberrant individual (after Willey)

Two eyes. Anterior region of about 14 segments, middle region 20–25 segments, posterior region numerous segments. On the fourth foot, 2–3 stout cylindrical setae which are not noticeably curved. *A single lanceolate seta in posterior dorsal ramus*. Tubes straighter, larger, more opaque than those of *P. socialis* Claparède, indistinctly annulated, more or less covered with sand grains.

*Length* of tube 120–220 mm

*Colour* milk-white anteriorly, black posteriorly. Reddish spots restricted to the long palps.

*Occurrence* Gulf of Mannar, Kiusadai Island. Mixed with tubes of *Mesochaetopterus* and *Axiothella*.

*Distribution* India, Zanzibar

329. *Phyllochaetopterus gardineri* Crossland (Fig 177, a–d).

*Phyllochaetopterus gardineri*, Crossland, 1904, p 280, pl XIX, figs 3–7

Two eyes. Anterior region of 15 segments, middle region of 24, posterior, numerous segments. On the fourth setigerous segment 3 strong, straight, flattened, light brown setae. *Dorsal ramus of the posterior region with one striated seta*. Tubes straight, occurring singly (?), 2.5 mm broad.

*Occurrence* Dredged off Minikoi Atoll, Maldive Archipelago

*Remarks* "This species is very closely related to *Ph. elioti*. It is readily separable, however, by its much larger size" (Crossland)

330. *Phyllochaetopterus aciculigerus* Crossland (Fig 178, b–d)

*Phyllochaetopterus aciculigerus*, Crossland, 1904, p 278, pl XVIII, figs 3–7

No eyes. Anterior region of 9 segments, middle region of only two, posterior region, numerous segments. On the fourth setigerous segment 8 thickened setae, of a brown colour, proximally strongly striated. *The first segment of the median region bears glandular ridges and two glandular canals arching over the back*, the second segment lacks these glandular appendages. The dorsal ramus of the posterior region are very small, conical, and contain about 9 long bent setae. Tube unknown.

*Breadth* 7 mm.

*Occurrence* Mamaduvani, South Mahlos Atoll, Maldivian Archipelago One specimen only

*Remarks* Closely allied to *Ph major* Claparède

331. *Phyllochaetopterus herdmani* Willey (Fig 177, 1-m)

*Phyllochaetopterus herdmani*, Willey, 1905, p 292, pl V, figs 127-132

Anterior region of 9-10 segments, middle region of only two segments, posterior region, 40-50 On the fourth setigerous segment 8-9 modified, flattened setae The first segment of the middle region bears neither glandular ridges nor glandular cirri The dorsal rami of the posterior region carry a bundle of 4 spatulate setae Narrow cylindrical tubes incrustated with relatively coarse sand grains and hard fragments of all kinds, including Foraminifera

*Occurrence* Ceylon, Galle shore, under stones

*Remarks* Closely related to *Ph aciculigerus*, the absence of a pair of glandular cirri on the first segment of the middle region being the chief difference.

### Genus MESOCHAETOPTERUS Potts

A pair of long peristomial tentacles Body divided into three regions, the anterior with 9-13 setigerous segments In the fourth setigerous segment are several enlarged dorsal setae In the median region, 2-3 elongated segments with continuous lateral borders and transverse ridges Notopodia rather enlarged, conical and fleshy, with a groove running down the internal border, the neuropodia are simple in the first, double in the succeeding segment, or segments In the posterior region, a large number of segments similar to those of *Chaetopterus*, but with much shorter notopodia A dorsal ciliated groove runs from the mouth, along the median line, to the posterior end In one or more of the median segments the lips are enlarged to form a fleshy organ

332 *Mesochaetopterus minutus* Potts (Fig 178, a).

*Mesochaetopterus minuta*, Potts, 1914, p 963, pl II-III, figs 7-8 Fauvel, 1930a, p 41, Monro, 1928, p 92, 1931, p 25  
*Spiochaetopterus spec*, Gravelly, 1927, p 24

"Very small, slender, living in tubes of a translucent, horny material, coated with coarse sand Prostomium

large and conical Peristomial collar well developed Just external to the tentacles is a pair of eyes The anterior region contains 10–13 segments, the median region is composed of two segments The first pair of notopodia are small and clavate, the second pair are of the type

Fig 178 — *Mesochaetopterus minutus* Potts a, dorsal view  $\times 13$  (after Potts) *Phyllochaetopterus aciculigerus* Crossland, b, mid-body together with adjoining segments  $\times 6$ , c, stout bristle from the 4th foot  $\times 47$ , d, setae from the anterior region  $\times 47$  (after Crossland)

described for the genus The ciliated groove expands into a cup in the middle of the second segment The posterior region is composed of segments which are double anteriorly, simple posteriorly, each notopodium has a single seta" (Potts)

Length 20 mm by 1 mm.

*Occurrence* Gulf of Mannar, Krusadai Island, edge of South Lagoon

*Distribution* Torres Strait, Great Barrier Reef, India, Atlantic Ocean, Cape Verde Islands, Panama

### Family CHLORAEMIDAE Malmgren

#### *Flabelligériens* Saint-Joseph

All segments nearly alike, short, papillose. Prostomium and buccal segment in the form of a retractile tube, with eyes, two stout palps and slender, retractile branchial filaments. The setae of the first segments are generally very long, directed forwards and forming a more or less marked cephalic cage. Parapodia biramous, rami far apart, generally without distinct setigerous processes. Dorsal setae simple, capillary, annulated or articulated. Ventral setae sigmoid, or hooked, or compound with sickle-shaped end-piece.

#### *Key to the genera of CHLORAEMIDAE*

#### Genus FLABELLIGERA Sars.

Body soft, short, transparent, enclosed in a thick mucous coating, containing long pediculate papillae. Dorsal setae capillary. Compound ventral hooks.

#### 333. *Flabelligera diplochaitos* Otto (Fig. 185, g-o).

*Flabelligera diplochaitos*, Fauvel, 1927a, p. 114, fig. 40, g-o.  
Monro, 1937, p. 304.

Buccal siphon short, with two groups of 40–50 slender green gills and two stout palps. Cephalic cage form-

ed by the four fascicles of the long setae of the first setigerous segment pointing forwards Dorsal setae very long and annulated Ventral hooks compound or semi-compound, with faintly curved terminal piece In each foot 4—6 hooks accompanied by a bundle of short, straight capillary, included, setae

*Length* 50—100 mm by 10 mm

*Colour.* Semi-transparent, blood green

*Occurrence.* Arabian Sea

*Distribution* Arabian Sea, Atlantic Ocean, Mediterranean Sea.

### Genus STYLARIOIDES Delle Chiaje

Body elongated, more or less cylindrical or club-shaped, coated with papillae Two stout palps Gills filiform, often very numerous, all similar, inserted on a more or less long peduncle, retractile A cephalic cage Dorsal setae long, capillary, annulated Ventral setae simple or rarely pseudo-compound, those beyond the first segments ending in a somewhat stout hook, sometimes bidentate Acicular setae slender Blood green

#### 334 *Stylarioides hamocarens* Monro (Fig 179, a).

*Stylarioides hamocarens*, Monro, 1937, p 302, fig 21

Body dotted with small papillae incrustated with mud A well developed cephalic cage formed by the first three setigerous segments which are provided with pedal lobes

these lobes are absent over the rest of the body. In the next segment dorsal and ventral setae of this same type, but considerably smaller, striated and ending in fine flagelliform tips. There is no trace of ventral hooks. Gills

Fig 179—*Stylarioides hamocarens* Monro a, anterior region, from above (after Monro) *Stylarioides parmatius* Grube b, dorsal view, with shield

numerous, filiform, borne on two separate, divergent, stout, membranous lobes, with their sides folded inwards. When unfolded, these lobes are more or less spoon-shaped in outline

*Length.* 23 mm. by 3 mm.

*Colour* in spirit, dark green in front, merging into yellow behind

*Occurrence.* North Arabian Sea, 759–1024 m.

335 *Stylarioides parmatius* Grube. (Fig 179, b)

*Stylarioides parmatius*, Grube, 1878, p 199, pl XI, fig 1 Willey, 1905, p 289, pl VIII, fig 5. Augener, 1926a, p 180, fig 5 Fauvel, 1930a, p 42, 1932, p. 179

*Stylarioides iris*, Michaelsen, 1892, p 108, fig 6.

Body much swollen anteriorly, abruptly tapering into a filiform tail, and bearing on the front part of the dorsum a kind of oval shield firmly coated with sand. Setae of the cephalic cage long, slender, iridescent, belonging to the 3 anterior segments. Skin papillae in cucular rows.

*Length* about 30 mm

*Occurrence* Madras, Ceylon

*Distribution* New Zealand, Philippine Islands, Madras, Ceylon, Madagascar

**336 *Stylarioides eruca* Claparède, var *indica* Fauvel**  
(Fig 170, *h-l*)

*Stylarioides eruca*, Fauvel, 1927a, p 119, fig 42, *h-l* (Synonymy)

*Stylarioides eruca*, var *indica*, Fauvel, 1928, p 93, fig 3, *h-i*, 1930a, p 42, fig 10, *h-l*, 1932, p 180

Body subtetragonal, thickly coated with sand, segments clearly marked. Skin-papillae small, short, not arranged in regular longitudinal rows. 3-4 longer papillae behind each bundle of setae. Branchiae numerous, filiform, inserted on a short peduncle, deciduous. Cephalic cage formed by the setae of the first three setigerous segments, long, slender, not iridescent, and pointing forwards. In the third segment, the *ventral setae are already bidentate*, and shorter than the dorsal ones. In the following segments, the ventral setae vary in length but are all ringed, bent at the tip, with a long slender sub-rostral spine.

*Length* 60 mm by 3-4 mm. About 70 segments

*Occurrence* Nankauri Harbour (amongst corals), Gulf of Mannar, Krusadar Island

*Distribution* Indian Ocean (typical form, Atlantic Ocean, Mediterranean Sea)

*Remarks* This variety differs from the type in having (1) shorter adhesive papillae, less numerous and less regularly arranged and (2) longer and more slender upper ventral setae.

**337 *Stylarioides bengalensis* Fauvel (Fig 180, *a-f*)**

*Stylarioides bengalensis*, Fauvel, 1932, p 180, fig 30, *a-f*

Anterior part of the body cylindrical or club-shaped, posterior part abruptly tapering into a filiform coiled tail. Segments numerous and hardly distinct. Body covered with small globular papillae which do not firmly

retain the sand. Buccal tube very long and protrusible, cylindrical, frilled at the edge. Branchiae slender, filiform, very numerous, set in several rows on a membranous horse-shoe shaped branchial lobe with edges rolled as in Serpulids. Two canaliculate palps with sinuous edges. Mouth opening trilobed, the two ventral lobes larger than

Fig 180—*Stylarioides bengalensis* Fauvel. a, b, base and tip of a dorsal seta  $\times 380$ , c, part of a bristle of the cephalic cage  $\times 380$ , d, ventral ramus  $\times 45$ , e, ventral hook  $\times 120$ , f, skin-papillae  $\times 150$ .

the dorsal. Cephalic cage formed by the setae of the first three setigerous segments arranged in three close-set concentric circles. The setigerous lobes of the third foot are more protruding and less far apart. These bristles, 3 to 5 in each bundle, are very long and stout, ringed and beautifully iridescent. On the next three segments, very small and slender dorsal capillary setae and a few fine ventral capillaries. On the following segments sigmoid ventral hooks.

*Length*. about 60 mm by 6–7 mm

**Colour.** in spirit, whitish-grey under the thin coating of fine reddish ooze adhering to the skin-papillae

**Occurrence** Sandheads, River Hughli, Madras Coast

338 *Stylarioides bifidus* Fauvel (Figs 181, *a*, *b*, 182, *a-e*).

*Stylarioides bifidus*, Fauvel, 1932, p 182, fig 31, pl VII, figs 15-16

Body gradually tapering backwards, segments clearly marked. Skin-papillae rather short and well apart, cylindrical in the anterior region, nearly globular in the hinder part. The body is not coated with sand but with

Fig 181—*Stylarioides bifidus* Fauvel *a*, anterior end, dorsal view,  $\times 6$ , *b*, branchial apparatus protruded (semischematic) (From Fauvel 1932)

fine ochraceous ooze. Buccal siphon ovate, with a delicate frilled membrane at the base, mouth small, with two short, canaliculate, puckered palps behind. Gills very small, slender, very numerous, inserted on two flattened, elongated, diverging lobes, free from the base and without any connecting membranes. Cephalic cage formed mainly by the first three setigerous segments and partly by the two succeeding ones. The bristles of the cephalic

cage are long slender, articulate, hardly iridescent and few in the first three segments, in which the feet are stout, protruding and directed forwards. Both rami are close together, the ventral one slightly behind the other. The dorsal setae of the following 10–12 segments are long, capillary, ringed, directed forwards, gradually decreasing in length, the ventral setae are shorter and fewer and

Fig 182—*Stylarioides bifidus* Fauvel. *a*, ventral hook  $\times 65$ , *b*, part of a dorsal seta  $\times 150$ , *c*, naked papillae  $\times 65$ , *d*, large ooze-coated papilla  $\times 65$ , *e*, smaller coated papillae  $\times 65$

some still exist with the ventral hooks which appear farther back and are only well marked in the posterior region. They are yellow, sigmoid, ringed, with a blunt tip and are about 5–6 in each ventral ramus.

*Length.* 70–80 mm by 4.5–5 mm.

*Colour* in spirit, greyish-white, with small, sparse, orange-coloured tubercles.

*Occurrence.* Travancore Coast, Arabian Sea, 300–555 fms.

## Genus BRADA Stimpson

**Skin papillae** The setae of the anterior segments do not form a marked cephalic cage. Two stout palps. Curiform branchiae in two clusters, retractile into the mouth. Dorsal ringed capillary setae, stouter simple ventral bristles. One pair of nephridial papillae protruding on one of the anterior segments.

*Key to the species of Brada*

- |                         |  |                                     |
|-------------------------|--|-------------------------------------|

| Body shorter            | Large skin papillae retaining sand grains  | <i>mammillata</i> Grube, p. 352     |

339. *Brada talehsapensis* Fauvel (Fig 183, a-d).

*Brada talehsapensis*, Fauvel, 1932, p. 164, fig. 32, pl. VII, fig. 17

Body long, cylindrical, nearly of the same breadth throughout, abruptly truncated at both ends, with a small rounded knob in front. About 45-60 segments. Few

Fig 183—*Brada talehsapensis* Fauvel. a, ventral hook  $\times 150$ ; b, part of a dorsal seta  $\times 150$ ; c, papillae  $\times 150$ ; d, anterior end, dorsal view,  $\times 12$ .

small skin-papillae, cylindrical, enlarged at the tip. On the ventral side of the 5th setigerous segment one pair of small, short, rounded nephridial papillae. Bristles of the first setigerous segment directed forwards, but few, slender, articulate, not iridescent. From the 2nd setigerous segment backwards, dorsal bristles shorter, bent, ringed, about 4–6 in each ramus. Ventral rami close to the dorsal ones. Ventral setae, 5–6 yellow curved hooks, with a slightly bent, smooth, translucent tip.

*Length* about 27–38 mm by 2 mm

*Colour* in spirit, greyish-white, with a coating of fine rusty, reddish ooze

*Occurrence.* Talèh-Sap, Gulf of Siam

### 340. *Brada mammillata* Grube

*Brada mammillata*, Grube, 1877, p. 541. McIntosh, 1885, p. 370, pl. XLIII, fig. II, pl. XXIII A, fig. 7–8. Ehlers, 1897, p. 109. Fauvel, 1932, p. 185.

Body gradually and faintly tapering backwards. Dorsal skin-papillae large, rounded, disposed in rows far apart, sand-retaining. Ventral papillae very small. On the ventral side of the 5th setigerous segment a pair of small conical nephridial papillae. Bristles of the first setigerous segment slender and directed forwards; they do not form a cephalic cage and are not iridescent. On the succeeding segments dorsal setae shorter. Ventral curved hooks from the 2nd setigerous segment, inserted on a round lobe encircled with long cylindrical papillae. Two short, stout, frilled palps. Gills numerous, slender, borne on two semi-circular pads.

*Length.* 40–50 mm by 5 mm.

*Occurrence* Arabian Sea, 555 fms

*Distribution* Patagonia, Kerguelen Island, Arabian Sea

*Remarks* *Brada villosa* (Rathke), a species smaller but very like *Br. mammillata*, has been reported from the Arabian Coasts (Fig 184, e–l).

### Genus DIPLOCIRRUS Haase

Body elongated or club-shaped, covered with sand-retaining papillae. Two palps. *Branchiae of two kinds* (1) filiform, (2) enlarged. Setae of the first setigerous segments longer than the others, directed forwards and forming a cephalic cage. Dorsal and ventral setae capillary, ringed.

341. *Diplocirrus glaucus* (Malmgren) (Fig 184, a—d)

*Diplocirrus glaucus*, Haase, 1914, p 195, fig 3—5 Fauvel, 1927a, p 120, fig 43, a—d, 1932, p 186

*Trophonia glauca*, Malmgren, 1867, p 192, pl XIV, fig 78

Body swollen anteriorly, moniliform posteriorly  
Skin-papillae small, elongated, sparsely disposed  
Buccal siphon long, protrusible, with four broad flat branchiae inserted on the anterior border and four slender cirri-form branchiae  
Four eyes  
Two long flattened palps  
Setae of the 1st setigerous segment few, very slender,

Fig 184—*Diplocirrus glaucus* (Malmgren) a, (after Malmgren), b, anterior part, gills extruded, dorsal view (after Haase), c, bristle  $\times 120$ , d, base of a bristle  $\times 320$  *Brada villosa* (Rathke) e, side view  $\times 5$ , f, papillae  $\times 48$ , g, three segments and nephridial papilla  $\times 10$ , h, foot encrusted with sand  $\times 48$ , i, part of a dorsal bristle  $\times 320$ , j, ventral bristle  $\times 120$ , k, tip of a ventral bristle in good condition, unbroken

pointing forwards On the 2nd setigerous segment they are shorter and decrease rapidly on the following ones, the rami of which are well apart Ventral setae shorter than the dorsal, more curved, with longer articles There are no hooks

Length 20—25 mm bv 2 mm

Occurrence. Mergui, 5 fms.

F. 47

*Distribution* Mergui Archipelago, North Atlantic Ocean

*Remarks* Though the retracted branchiae could not be observed in the Mergui specimen, it may, somewhat doubtfully, be attributed to *Diplocirrus glaucus* by the appearance of the setae

*Incertae sedis*

342. *Ilyphagus hirsutus* Monro

*Ilyphagus hirsutus*, Monro, 1937, p 304, fig 22

The description of this "sac-like creature, shaped like an *Echinus*, with a dense uniform, fur-like covering of long coniform papillae" is really too scanty to fix its place By its setae, it appears to belong to the Chloraemidae One might wonder whether it be not a bad specimen of *Buskiella abyssorum* McIntosh?

*Length.* 39 mm by 14 mm

*Occurrence* Arabian Sea, 3385 m

Family SCALIBREGMIDAE Malmgren.

Body club-shaped, or short fusiform. Prostomium small, bilobed, or with frontal peaks Sometimes eyes in clusters Two nuchal grooves Peristomium achaetous Proboscis soft, unarmed Skin generally tessellated or corrugated Segments subdivided into annuli. Dorsal and ventral rami each bearing setae of two kinds, viz. simple capillary setae and furcate setae, sometimes also acicular setae Gills, when present, limited to a few anterior segments.

*Key to the genera of SCALIBREGMIDAE*

1 Acicular setae on the first segments

*Parasclerocheilus*  
Fauvel, p 355

Acicular setae absent

*Scalibregma* Rathke, p 354

Genus SCALIBREGMA Rathke

Body arenicoliform Prostomium T-shaped, with two elongated frontal peaks Gills present on the anterior segments Parapodia prominent, flattened Dorsal and ventral cirri, Acicular setae absent.

343 *Scalibregma inflatum* Rathke (Fig 185, a-f).

from the 16th-18th segments backwards Lateral ciliate organ between the rami. Acicular setae absent

Length. 10-60 mm by 2-10 mm

Colour in life vermillion-red, spotted with yellow

Occurrence Gulf of Oman, 609 fms

## Genus PARASCLEROCHEILUS Fauvel

Body fusiform, elongated Prostomium T-shaped, with two long frontal peaks and eye-spots Nuchal organs protractile Peristomium achaetous Proboscis unarmed Anterior segments divided into superficial rings A few anterior segments bearing branchiae Dorsal and ventral rami reduced to stout rounded processes Dorsal cirri absent A cirrus-like process above the ventral ramus in

the posterior region. Lateral organs. Acicular setae in the dorsal ramus of the first setigerous segments. Forked setae in the following segments. Anal cut finger-like.

311 *Parasclerocheilus branchiatus* Fauvel (Fig. 186, a-l)

*Parasclerocheilus branchiatus* Fauvel, 1928, p. 159, fig. 1, a-l  
1930, p. 41, fig. 11, 1932, p. 188

Body rather long, nearly uniform in breadth, slowly tapering backwards, rectangular in section, with a more or less marked ventral groove. Prostomium globular, with two diverging, thick, tentacle-like processes. Four red pigmented plates, linear, arched, converging (eye spots).

FIG. 186—*Parasclerocheilus branchiatus* Fauvel. a, anterior region, proboscis extruded, dorsal view  $\times 6$ , b, pygidium  $\times 8$ , c, dorsal foot  $\times 21$ , d, 10th foot  $\times 21$ , e, 40th foot  $\times 21$ , f, hook from the 2nd segment  $\times 210$ ; g, tip of a lower hook  $\times 320$ , h, tip of an upper hook  $\times 320$ , i, curved seta from the 2nd setigerous segment  $\times 210$ , l, forked seta  $\times 320$ .

Two protractile cushion-shaped nuchal organs. Peristomium achaetous. Proboscis huge, campanulate. Segments divided into four rings, nearly smooth on the ventral side, rough and corrugated on the dorsal. In the first four setigerous segments, the dorsal ramus carries, in front of a bundle of long capillary setae, large curved acicular setae with a hook at the tip. Of the other dorsal and ventral setae some are capillary, slender and smooth,

while the others are shorter and slightly bent. In the succeeding segments, the dorsal and ventral rami are similar, and in the form of thick rounded processes, without cirri, and each bearing a bundle of capillary setae and shorter, forked, setae with limbs unequal and ciliated on the inner edge. From the 29th setigerous segment to the last one a short slender finger-like process is inserted *above* the ventral ramus. In the last segments this process reaches one-fourth or one-third of the breadth of the body. A lateral organ lies between the two rami. *There are six pairs of branchiae* from the 2nd to the 7th setigerous segment, arborescent, densely ramified as in *Scalibiegma*. The first pair, the smallest, has 6—7 filaments, the four last ones are sub-equal and much larger. They are inserted behind the dorsal setae. Pygidium short, with broad terminal vent and 6 anal cirri. 1 dorsal, 1 ventral and 2 on each side.

*Length* 35 mm by 3 mm

*Colour* Discoloured in alcohol, with the exception of the reddish-carmine eye-spots.

*Occurrence* Mergui Archipelago, Paway Island, Gulf of Mannar, Krusadai Island.

*Distribution* India, Gulf of Oman.

*Incertae sedis*

345 *Oncoscolex microchaetus* Schmarda, 1861, p. 56. Trincomalee.

### Family OPHELIIDAE Grube

Body rather short, dorsum arched, ventral side flat, or with a longitudinal groove. Prostomium conical, destitute of appendages. Cephalic eye-spots hidden under the skin. Often lateral eye-spots on the segments. Segments more or less clearly subdivided into annuli. Proboscis unarmed. Nuchal organs protrusible. Gills cirri-form (very rarely branched) or absent. Feet biramous, often reduced to dorsal and ventral bundles of capillary setae. Dorsal cirri absent. Sometimes a few ventral cirri. Lateral sense-organ between the parapodial rami. Pygidium bearing papillae, and often an anal funnel.

### Genus ARMANDIA Filippi.

Body elongated, not divided into distinct regions, a deep median and two lateral ventral grooves. Prostomium conical. Eyes on the brain under the skin. Segments divided into annuli. Cirriform gills all along the body from the 2nd setigerous segment. Parapodia with only two bundles of capillary setae. A small ventral cirrus. Anal funnel fringed with papillae, and a median cirrus. Lateral eye-spots on many segments.

*Ophelina leptocirris*, Grube, 1878, p 194

33 to 38 setigerous segments Gills from the 2nd setigerous segment to the last one 10–12 pairs of lateral eyes from about the 7th setigerous segment Anal funnel long, compressed, slantingly cleft, fringed with long papillae A long median anal cirrus

*Length* 15–30 mm

*Colour* Decoloured in spirit

*Occurrence* Andaman Islands, Gulf of Mannar, Kiusadai Lagoon, burrowing in sand

*Distribution* New Caledonia, Philippine Islands, Indo-China, Andaman Islands, Gulf of Mannar, Persian Gulf, Red Sea

### Genus AMMOTRYPANE Rathke

Body vermiform, not divided into distinct regions A deep ventral groove all along the ventral side and two lateral ridges Prostomium conical Cephalic eyes hidden under the skin *No lateral eyes* Segments divided into annuli Cirriform gills from the 2nd setigerous segment nearly to the end Parapodia with short setigerous lobes and two bundles of simple setae A small ventral cirrus Anal funnel with papillae and anal cirrus

#### 348 *Ammotrypane aulogaster* Rathke (Fig 187, a–e)

*Ammotrypane aulogaster*, Fauvel, 1927a, p 133, fig 47, a–e, 1932, p 190 Hoagland, 1920, p 625

Prostomium conical, ending in a filiform clavate tip Gills absent only on the last 3–4 segments Ventral cirri small, conical Anal funnel spoon-shaped, with a large ventral opening fringed with small papillae Two large ventral papillae and a median anal cirrus with a long cirrostyle borne on a cylindrical cirrophore.

*Length.* about 50 mm by 3 mm 60–68 segments

*Colour* pearl-grey. Gills red

*Occurrence* Orissa Coast, Madras, Ennur Backwater, Persian Gulf

*Distribution* Philippine Islands, India, Persian Gulf, Atlantic Ocean, Arctic Seas

### Genus POLYOPHTHALMUS Quatrefages

A longitudinal ventral groove Prostomium short Cephalic and lateral eye-spots Nuchal organs protrusible *Gills and ventral cirri absent* Biramous parapodia with capillary simple setae Anal funnel fringed with papillae

349 *Polyophthalmus pictus* Dujardin (Fig 187, l-o)

*Polyophthalmus pictus*, Fauvel, 1927a, p 137, fig 48, l-n, 1930b, p 546, 1932, p. 191

*Polyophthalmus setosus*, Michaelsen, 1892, p 16, fig 14

*Polyophthalmus australis* Grube, Willey, 1905, p 289

27-28 setigerous segments There are no prominent setigerous lobes Only a single bundle of capillary setae

Fig 187—*Ammotrypane aulogaster* Rathke a, side view  $\times 2$ , b, anterior part  $\times 8$ , c, anal tube, ventral view, median cirrus lost  $\times 5$ , d, posterior part with anal tube, side view  $\times 6$ , e, foot from mid-body  $\times 8$  *Polyophthalmus pictus* (Dujardin) f, side view  $\times 5$ , g, head, nuchal organs everted  $\times 10$ , h, posterior part with anal tube  $\times 10$ , i, several kinds of dorsal patterns

in each foot, except in the last ones Nephridial pores on segments 8-11

Length 10-25 mm by 1-2 mm

Colour extremely variable, brown spots or streaks, more or less conspicuous and arranged in several different dorsal patterns, this has caused it to be described under

many names which are really synonymous. The *P. longisetosus* Michaelsen, found pelagic at Ceylon, is only the epitocous swimming form, with long bristles, which swarms on the surface when mature.

**Occurrence** Gulf of Mannar, Ceylon, Pamban, Kilakarai, Maldivé Archipelago, Fehendu

**Distribution** Pacific, Indian and Atlantic Oceans, Mediterranean Sea. Cosmopolitan

### Genus TRAVISIA Johnston

Body divided into two distinct regions, an anterior enlarged and a posterior narrow, square in section. There is no marked ventral groove. Prostomium small, conical. Two nuchal organs. Proboscis unarmed, soft, globular, more or less lobed. Segments divided into annuli. Branchiae from the 2nd setigerous segment, cirriform, or very rarely branched. Dorsal and ventral rami reduced to a bundle of capillary setae. In the posterior region, huge lateral fleshy processes. Ventral cirri absent. A lateral sense organ between the rami. Pygidium, a rounded lobe.

350 *Travisia arborifera* Fauvel (Fig 188, a-f).

*Travisia arborifera*, Fauvel, 1932, p 191, fig 33, a-f

Fig 188 — *Travisia arborifera* Fauvel. a, posterior foot  $\times 65$ , b, posterior gill  $\times 65$ , c, gill from mid-body  $\times 85$ , d, part of a gill  $\times 85$ , e, polygonal glandular areas of the tegument  $\times 75$ , f, part of a seta  $\times 350$

Body short, plump, spindle-shaped 36 setigerous segments subdivided into annuli. Posterior segments imbricated, square in section. Skin divided into polygonal glandular areas. Prostomium rounded, ending in a small conical tip. Two small nuchal organs. *Gills branched*, beginning on the 2nd setigerous segment and missing only on the last 6–7 segments. Dorsal and ventral rami far apart and each reduced to a bundle of simple, smooth, or very finely barbed capillary setae inserted in a pit. A small triangular fleshy lamella in front of the gills, a similar, slightly larger, lamella in the ventral ramus. In the posterior part of the body these lamellae are larger. A lateral pit-like sense organ between the rami, conspicuous even on the first setigerous segment. Nephridial pores from the 3rd to the 14th setigerous segment. Pygidium ending in a knob with 6–8 short cirri. Vent terminal.

*Length* 10–38 mm by 3–10 mm

*Occurrence* Andaman Sea, 53 fms. off Puri, Orissa, 4–4½ fms.

### Family CAPITELLIDAE Grube

Body divided into a thorax and an abdomen. Prostomium conical, without appendages. Proboscis unarmed, papillose. Peristomium achaetous. Branchiae simple, compound, or absent altogether. Parapodia biramous. Dorsal and ventral cirri absent. Capillary setae and hooks borne on uncinigerous tori. Lateral sense-organs.

dorsal ridges and of the upper end of the ventral tori Genital pores from the 2nd abdominal segment. Very brittle in the posterior part.

*Length:* 150—300 mm by 3—5 mm.

*Colour:* in life, bright red anteriorly

*Occurrence:* Andaman Islands, Bay of Bengal, Ceylon, Gulf of Oman.

*Distribution* Magellan, Chile; Bay of Bengal, Gulf of Oman, Atlantic Ocean, Mediterranean Sea, Falkland Islands

352. *Notomastus giganteus* Moore.

*Notomastus giganteus*, Moore, 1906, p 227, pl XI, figs 24–25  
Fauvel, 1932, p 194

*Dasybranchus giganteus*, Moore, 1909, p 279, pl IX, fig 57

Body of large size Prostomium rounded, with a small conical tip Without eyes Thoracic segments bi-annulate and partly tessellated Eleven segments with capillary dorsal and ventral setae First abdominal dorsal tori very small, connected across the dorsum by a low transverse fold posteriorly they become obsolete First abdominal ventral tori ending in a sharp upper process which decreases in size farther back Gills retractile and usually obscured anteriorly, on the middle and abdominal segments they become conspicuous bushy tufts, composed of numerous (about 20–30) filaments arising from the posterior end of the dorsal tori, or posteriorly, when the tori become obsolete, replacing them A pair of large genital pores on the first 9 abdominal segments

*Length.* 140 mm and more, by 7 mm

*Occurrence* Off Puri, Orissa, 4–4½ fms, N. E. of Ceylon, 200–350 fms

*Distribution* North Pacific Ocean, Gulf of Georgia, San Diego, California, India, Ceylon.

Genus DASYBRANCHUS Grube.

Thorax with thirteen setigerous segments bearing only capillary setae Abdomen with only hooks inserted on dorsal and ventral tori *Retractile gills* inserted at the upper end of the abdominal tori

353 *Dasybranchus caducus* Grube. (Fig 190, a–h)

*Dasybranchus caducus*, Eisig, 1887, p 823, pl XVII–XXIII  
Fauvel, 1927a, p 148, fig a–h Monro, 1937, p 305

*Dasybranchus cirratus*, Grube, 1867, p 28, pl III, fig 4

Prostomium small, conical Peristomium long, achae-tous Compound gills, with numerous simple filaments, from about the 20th abdominal segment Body tough Genital pores from the last thoracic segment

*Length* 250–300 mm. by 10–15 mm

*Colour* in life thorax blood red, abdomen yellowish  
Gills red

**Occurrence** Burma, off Akyab; Andaman Islands, Gulf of Mannar, Maldivé Archipelago

**Distribution.** Pacific, Indian and Atlantic Oceans

Fig 190—*Dasybranchus caducus* Grube a, anterior part, natural size b, postomium, side view, c, posterior end, d, segments of the middle region of the abdomen, from above downwards, dorsal tori, lateral knobbed-organ, branchial vesicles, compound gills, ventral tori, nephridiopores between the gills, e, last thoracic segments and first abdominal ones, side view, f, thoracic bristle, g, h, hooks, front and side view *D. gajolae* Eisinger i, prosomium, k, compound gill, l, parapodial gland, m, n, hooks (after Eisinger)

### Genus HETEROMASTUS Eisinger

Thorax with eleven setigerous segments, the first five with only capillary setae, the next six with long stalked hooks. Abdomen with only shorter hooks inserted on tori. Posterior segments campanulate, or strobiliform. The parapodial gills are but an extension of the ventral tori. A median anal cirrus.

#### 354. *Heteromastus similis* Southern (Fig 191, a—d)

*Heteromastus similis*, Southern, 1921, p 640, pl XXIX, fig 3  
Fauvel, 1930a, p 46, 1932, p 195

*Heteromastus* sp., Gravely, 1927, p 26

Prostomium conical, pear-shaped Peristomium long, achaetous Body long, slender, swollen at the anterior end, tapering gradually to the tail The first abdominal segments are not conspicuously elongated Lateral lobes absent in the posterior moniliform segments

Fig 191—*Heteromastus similis* Southern a, anterior end, side view  $\times 12$ , b, posterior end, side view  $\times 36$ , c, 180th segment, dorsal view  $\times 36$ , d, ventral hook from the 86th segment  $\times 420$  *Barantolla sculpta* Southern e, dorsal view of segments 115-118  $\times 25$ , f, lateral view of gills and dorsal lobes in the posterior segments  $\times 636$ , g, tip of a dorsal hook from the 7th foot  $\times 553$  *Mastobranchus indicus* Southern h, tip of a long hook from the ventral division of the 11th foot  $\times 713$ , i, tip of the dorsal hook from the 14th foot  $\times 713$  (after Southern)

**Length.** 215 mm and more by 15–18 mm

**Remark** Hardly distinct from, and, probably synonymous with, *H. filiformis* Claparède

**Occurrence** Taléh-Sap, Gulf of Siam, Chilka Lake, Vizagapatam, Kutikal, Gulf of Mannar

#### Genus HETEROMASTIDES Augener

Thorax with 12–13 setigerous segments with capillary setae on both ramus abdomen with hooks There are no gills An anal plate with two cirri.

355. *Heteromastides bifidus* Augener. (Fig 192, a—b)

*Heteromastides bifidus*, Augener, 1914, p 64, fig 8, pl 1, fig 11  
 Fauvel, 1930a, p 47, fig 12

Prostomium bluntly finger-shaped. Two lateral clusters of small eye-spots. Abdominal segments more or less moniliform. The 4—5 penultimate segments are provided with a small triangular process pointing backwards, the

Fig 192—*Heteromastus bifidus* Augener a, anterior region, side view  $\times 40$ , b, posterior region and pygidium  $\times 40$

last carries, on each side, a small globular swelling. A broad, round, anal plate, slightly slanting, bearing two long finger-shaped diverging cirri.

**Length:** 10 mm by 0.8 mm : upwards of 70 segments.

**Occurrence:** Gulf of Mannar, Krusadai Island

**Distribution.** Australia; India.

### Genus **PARAHETEROMASTUS** Monro

"Thoracic region of twelve segments of which eleven are setigerous. Of these eleven, the first four carry bordered capillary bristles only, and the remaining seven only hooks with narrow stems and long guards. The abdomen carries only hooks, different from those of the thorax. There is no tessellation of the thorax. In the abdominal region, there is little development of the parapodial tori and no branchiae are present. The pygidium has a single rather short cirrus." (Monro)

356 *Paraheteromastus tenuis* Monro. (Fig 194, c-f).*Paraheteromastus tenuis*, Monro, 1937, p 536, fig 2b

The body swells out in the anterior thoracic region. Division between thorax and abdomen not conspicuous. Prostomium short, conical, without eyes. The first 4 setigerous segments carry only short, widely bordered capillary bristles. The remaining 7 thoracic segments carry only rather large hooks with narrow stems and long guards. The abdominal hooks are smaller than the thoracic and have a subterminal enlargement and shorter and more rounded guards.

The body in the long abdominal region is externally almost as featureless and homogeneous as that of an *Oligochaete*. The parapodial ridges are very little developed. In the hindmost part they are represented by a slight swelling of the segments in the dorso-lateral and ventro-lateral regions. There are no branchiae and the hinder abdominal segments are not campanulate. A short pygidial cirrus.

*Length* 50 mm by 0.5 mm 140 segments.

*Colourless*, in spirit

*Occurrence* Maungmagan, Burma

Genus *MASTOBRANCHUS* Eising

Thorax of eleven setigerous segments *with only dorsal and ventral capillary setae*. Abdomen with capillary setae and hooks on the dorsal ramus and hooks only on the ventral ramus. Thoracic feet claviform. Anterior abdominal segments long, cylindrical, *the posterior ones strobiliform or campanulate*. Parapodial gills simple, next compound and retractile.

357. *Mastobranhus indicus* Southern (Fig 191, h, i)*Mastobranhus indicus*, Southern, 1921, p 645, pl XXX, fig 25

Prostomium small, rounded. No eyes. Skin of the anterior region tessellated. Lateral organs not very distinct. 4 pairs of genital pores behind the segments 8-11. Torsion in segments 2-4 very short, longer on the subsequent segments. The right ventral bundles of the 11th foot contain two very elongate hooks. The dorsal bundles on 13th and 14th segments contain only capillary setae, the ventral bundles only hooks, that are much larger and shorter than those of the right 11th foot. In the dorsal bundle of the 15th segment there are only hooks.

*Length* 46 mm by 3 mm Only an imperfect specimen with 90 segments Gills and posterior part unknown

*Occurrence.* Barantolla, near Calcutta, from brackish pools, salt lakes.

### Genus BARANTOLLA Southern

"Capitellidae having 12 thoracic segments, of which the first is achaetous Segments 2-7 have only capillary setae, segments 8-12 only elongate crochets The abdominal segments have short crochets only The anterior thoracic segments have reticulate markings on the skin, and the sculpture of the thoracic segments is rather elaborate Branchiae in the form of short finger-shaped lobes behind the dorsal setae of the middle and posterior segments. These segments are provided each with a membranous collar, produced into four shallow parapodial lobes" (Southern)

#### 358. *Barantolla sculpta* Southern (Fig 191, e-g)

*Barantolla sculpta*, Southern, 1921, p 643, pl XIX, fig 24 Fauvel, 1932, p 196

Body widest near 4th-5th segment, very gradually tapering backwards Prostomium two-ridged, without eyes Proboscis covered with minute papillae First four segments tessellated Capillary setae with narrow wings In segments 8-12 only long hooks resembling those of *Heteromastus*, ending in a strong tooth with 5-6 slender spines on the crest and a long hood Abdominal crochets much smaller Gills begin about 55th-60th-70th segments, they lie under the dorsal parapodial lobes, each consisting of 3-4 short rounded lobes hidden by the parapodial lobes the larger possess up to 9-11 finger-shaped lobes A median anal cirrus

*Length* 55-60 mm by 2-3 mm. Segments numerous

*Occurrence* Taléh-Sap, Gulf of Siam, Barantolla, near Calcutta

### Genus CAPITELLETHUS Chamberlin.

*Capitellides* Ehlers, non Mesnil

Thorax exclusively with capillary setae, abdomen with crochets exclusively Branchiae none Eleven setigerous thoracic segments, no other macroscopic distinction between thorax and abdomen,

359 *Capitellethus dispar* (Ehlers)

*Capitellethus dispar*, Chamberlin, 1919, p 466 Fauvel, 1930b, p 548, 1932, p 197

*Capitellides dispar*, Ehlers, 1907, p 24, fig 15

*Notomastus zeylanicus*, Augener, 1926a, p 172, 1927a, p 218 (non Willey?)

The characters of the one species are those of the genus The body slender, filiform, without any apparent difference between the thorax and the abdomen, is very like that of an *Oligochaete*

*Length* 15 mm by 0.8 mm

*Occurrence* Vizagapatam

*Remarks* Augener identifies this species with *Notomastus zeylanicus* Willey (1905), but I very much doubt their synonymy.

Genus *BRANCHIOCAPITELLA* Fauvel

Thorax with seven setigerous segments, bearing dorsal and ventral capillary setae On the 8th and 9th segments ventral hooks and a dorsal copulatory organ with modified large spines In the abdomen dorsal and ventral hooks and *dorsal cinniform gills*

360. *Branchiocapitella singularis* Fauvel (Fig 193, a—f)

*Branchiocapitella singularis*, Fauvel, 1932, p 197, pl VII, figs 9—14

Body slender, filiform, slightly enlarged in the thorax, about 200 segments or more Skin faintly tessellated in the anterior segments Prostomium blunt conical, without eyes Peristomium achaetous, short ventrally and overhanging the prostomium on the dorsal side where it is twice as long The first 8—9 segments biannulate, larger and more swollen than those following Maximum breadth about the 6th segment The first 7 setigerous segments bearing each two dorsal and two ventral bundles of capillary setae On the 8th and 9th segments ventral hooded hooks and a dorsal copulatory apparatus armed with 8 large, bent, acicular spines (two in each ramus) converging towards the boundary of the two segments between which opens the male genital pore In each dorsal ramus there are two bristles, a long one and a shorter supplementary seta An ovate gland lies between the posterior bristles From the 10th setigerous segment

backwards dorsal and ventral hooded hooks. In the abdominal region the body is semi-circular in section. Dorsal and ventral uncingerous tori are short, little raised, transverse pads. About the 80th setigerous segment

Fig. 193—*Branchiocapitella singularis* Fauvel. a, anterior end, dorsal view  $\times 8$ , b, posterior region, dorsal view  $\times 8$ , c, cross section of abdomen  $\times 10$ , d, segments 6 to 11 and dorsal capulatory organ  $\times 25$ , e, right posterior pair of copulatory spines  $\times 147$ , f, abdominal hook  $\times 630$  (from Fauvel 1932)

the gills make their appearance, they are small, finger-shaped, with one or two filaments inserted on the inner end of the dorsal tori. Pygidium a short faintly bilobed knob.

*Length* up to 95 mm by 1 mm

*Decoloured*, in spirit.

*Occurrence* Barantolla or Vizagapatam.

### Genus SCYPHOPROCTUS Gravier.

Thorax of 14 segments, of which 12 carry only capillary setae. Abdomen with only hooded hooks. No gills. An anal cup-shaped funnel with radiating acicular bristles. Two long anal cirri.

361 *Scyphoproctus djiboutiensis* Gravier. (Fig. 194, a, b).

*Scyphoproctus djiboutiensis*, Gravier, 1906, p 181, pl III, figs 200–204 Fauvel, 1930a, p 48

Piostomium short, conical, eyeless The first two segments achaetous Capillary setae long and slender. Dorsal and ventral abdominal toli without processes The

Fig 194—*Scyphoproctus djiboutiensis* Gravier a, anterior part, dorsal view, b, anal funnel, side view (after Gravier) *Paraheteromastus tenuis* Monro c, segments from mid-abdominal region, d, terminal segments, side view, e, anterior thoracic bristle, f, abdominal hook, g, thoracic hook (after Monro)

anal funnel is a cup-like plate, the walls of which are stiffened with bundles of acicular setae. It is provided with two long finger-shaped cirri

**Length:** 25 mm. by 0.6 mm

**Colour** yellowish-brown

**Occurrence.** Gulf of Mannar, Krusadai Island

**Distribution:** India, Red Sea

Genus *PULLIELLA* Fauvel

Body divided into three distinct regions. (1) thoracic, the 9 segments of which bear only capillary setae in both ramī, (2) abdominal, with hooks in both ramī and dorsal tori well apart, (3) posterior *with dorsal acicular setae and ventral hooks*. The last segments are partly fused together. Pygidium with two stout, conical, ventral curi. Branchiae absent.

362 *Pulliella armata* Fauvel (Fig 195, a-h).

*Pulliella armata*, Fauvel, 1930a, p 48, fig 13, 1930b, p 549, 1935, p 342.

Body swollen at both ends. Three regions clearly distinct. Prostomium blunt, two eyes. Peristomium achaetous, biannulate. The nine following segments are short, close together, biannulate, smooth, without any

Fig 195—*Pulliella armata* Fauvel a, anterior region, side view  $\times 6$ ; b, posterior region, side view  $\times 6$ , c, pygidium and last segments, from above  $\times 6$ , d, a row of posterior dorsal acicular spines  $\times 48$ , e, ventral posterior hook  $\times 280$ , f, g, dorsal anterior hooks  $\times 280$ , h, tip of a posterior acicular dorsal seta  $\times 280$ .

pattern and each carrying two dorsal and two ventral bundles of capillary setae, inserted into hollow (retractile?) eminences. In the next three segments, the dorsal and ventral hooks are arranged in transverse rows, faintly raised but not forming true tori. The following abdominal segments bear two short prominent dorsal tori well

apart. The first ventral tori are longer than, and closer to, the dorsal tori, next they become nearly as short as the dorsal tori. The posterior region numbers 8–11 segments, larger than the preceding ones, short, conspicuous, separated from each other by a narrow and deep constriction. They carry, on the dorsal side, stout, bodkin-like acicular setae, arrayed in two rather wide apart rows, and on the ventral side hooks like those of the abdomen. Pygidium on the ventral edge of the last setigerous segment, with two stout, conical, diverging cirri under the anus. On the 4th–5th abdominal segments, a dorsal raised swelling between the tori and somewhat behind them. There are no branchiae.

*Length.* 15–25 mm by 2–3 mm

*Remarks.* This species is a connecting link between *Scyphoproctus* and the other Capitellids.

*Occurrence.* Pulli Island, Gulf of Mannar.

*Distribution.* New Caledonia, Indo-China, India.

### Family ARENICOLIDAE Johnston.

To my knowledge no species of *Arenicola* has been, as yet, recorded from the area of India. *Arenicola* species are of rare occurrence in the tropical part of the Indian Ocean.

### Family MALDANIDAE Malmgren

Body nearly cylindrical, segments long and few. Pro-stomium small, destitute of appendages. A median keel on each side of which is a nuchal groove, often with a more or less rimmed cephalic plate. Buccal segment (peristomium) achaetous. Parapodia biramous, a dorsal setigerous lobe with capillary bristles, a ventral uncinigerous torus. Dorsal and ventral cirri absent. Ante-anal segments often achaetous. An anal funnel with cirri, or an anal plate. Cutaneous glands well developed. Tube membranaceous, coated with sand or mud, or hard, arenaceous.

#### *Key to the genera of MALDANIDAE*

- 1 Head with a cephalic plate surrounded by a thickened margin or not

2

- Head without a bordered plate
- A foliaceous anal plate

*Petaloproctus*  
Quatrefages, p. 384.

|   | Cephalic keel short and flat  | <i>Asychis</i> Kinberg, p 385     |

*Remarks* In the Maldanidae the head, anterior segments, and the pygidium, provide the most important features which differentiate species and genera. *Petalopioctus* and *Nicomache* differ mainly in the structure of their pygidium, whilst the head and anterior segments are almost alike. Incomplete specimens can, therefore, be but exceptionally identified with certainty. Unfortunately, Maldanidae are very brittle worms and are often incomplete in the collections.

### Genus CLYMENE Savigny.

A slanting, rimmed, cephalic plate. Acicular ventral bristles in the first three setigerous segments. Several ante-anal achactous segments. Pygidium funnel shaped, bordered with cirri. Anus at the tip of a cone enclosed in the funnel. Glandular coloured belts on the anterior segments.

#### *Key to the subgenera of Clymene*

*Praxillella insecta*, Augener, 1926a, p 192

Body with 19 setigerous segments and 3 ante-anals Dorsal cephalic plate oval, a long keel. rim with two lateral sides notched, posterior part smooth Nuchal grooves long, parallel Ventral acicular hooks of the three anterior segments with a slightly smooth tip Caudal funnel fringed with short cirri, the ventral median cirrus slightly longer than the others.

*Occurrence* Vizagapatam, Madras

*Distribution* New Zealand, India

365 *Clymene* (*Euclymene*) *grossa* Baird (Fig 196, f—h)

*Clymene grossa* Baird, Ehlers, 1901, p 190, pl XXV, figs 1—4  
Fauvel, 1932, p 200

Body with 19 setigerous segments and one achaetous ante-anal Cephalic plate oval, with a long keel and elongate parallel nuchal grooves Posterior part of the rim

Fig 196—*Euclymene annandalei* Southern a, anterior end, dorsal view  $\times 14$ , b, posterior end, ventral view  $\times 10$  (after Southern) *E watsoni* Gravier c, posterior part, side view, d, head, dorsal view, e, acicular bristle from the 2nd foot (after Gravier) *E grossa* Baird f, head, dorsal view, g, anal funnel  $\times 2$ , h, hook  $\times 210$  *E insecta* (Ehlers) i, head  $\times 5$ , k, posterior part  $\times 3$ , l, hook  $\times 270$ , m, top of acicular bristle from the first segments  $\times 270$  (after Ehlers)

of the plate denticulated The five anterior segments are short, with an anterior raised margin, especially the fourth 2—3 large, yellow, straight acicular hooks in the

ventral rami of the three anterior segments    Anal funnel with short subequal cirri

*Length*    100–125 mm by 6 mm

*Occurrence*    Andaman Islands

*Distribution*    Magellan Strait, Andaman Islands

366    *Clymene* (*Euclymene*) *watsoni* Gravier    (Fig 196, c–e)

*Clymene watsoni*, Gravier, 1906, p 198, pl III, figs 214–216  
Fauvel, 1932, p 200

Body of 19 setigerous segments, 2–3 ante-anals  
Cephalic plate oval, a short keel    Nuchal grooves short, nearly parallel    Posterior rim crenate    Anterior segments short, with a raised anterior margin. 2–3 acicular bent hooks on the 3 anterior ventral rami    Caudal funnel with numerous short, triangular, equal cirri

*Length*    about 200 mm

*Colour*    the 4th, 5th and 6th setigerous segments deep red.

*Occurrence.*    Sinai Peninsula

*Distribution*    Red Sea, Djibouti, Suez.

367    *Clymene* (*Euclymene*) *santanderensis* Rioja (Fig 189, a'–h')

*Clymene santanderensis*, Rioja, 1917, p 1, fig 1    Fauvel, 1927a, p 177, fig 61, a–h, 1932, p. 200

(?) *Clymene monilis*, Fauvel, 1901, p 89, figs 31–32

(?) *Macroclymene monilis*, Augener, 1918, p 485, fig 78

Segments very numerous, about 40. Body very brittle  
Cephalic plate oval, rim with two lateral and one posterior notch    Keel and nuchal grooves straight and long  
Ventral acicular spines on the first three setigerous segments bent hooks with enlarged manubrium, one in each ramus    One achaetous ante-anal segment    Pygidial funnel fringed with numerous alternating cirri    The first four anterior segments very short    The 7–8 last segments very short, but with setae

*Length*    100–175 mm

*Uncoloured*, in spirit

*Occurrence*    Vizagapatam.

*Distribution*    India, West Coast of Africa (?), Santander

*Remarks* Very long fragments, with very numerous segments, from Vizagapatam but not one whole specimen. The identification, although very probable, is nevertheless a little doubtful.

### Subgenus PRAXILLELLA Verrill

368. *Clymene* (*Praxillella*) *gracilis* Sars. (Fig 201, a-d).

*Clymene* (*Praxillella*) *gracilis*, Fauvel, 1927a, p 178, fig 62, m-p, 1932, p 201 Moore, 1928, p 238

Prostomium long and tapering. Ocelli present. Cephalic plate oval, rim notched on the sides and back. Keel and nuchal organs straight and long. 1-3 ventral acicular spines in the first three setigerous segments. 4 achaetous ante-anals. Anal funnel with a longer median cirrus. Anal cone protruding.

*Length:* 35-75 mm. by 1-2 mm

*Occurrence:* Persian Gulf.

*Distribution:* California, Persian Gulf, Atlantic Ocean, Mediterranean Sea.

### Genus AXIOTHELLA Verrill

*Axiothea* Malmgren.

A cephalic rimmed plate. Pygidium funnel shaped, fringed with cirri. Without collar. Denticulated uncini from the first setigerous segment.

#### *Key to the species of Axiothella*

Slender bipinnate setae present *australis* Augener, p 381

Slender bipinnate setae absent . *obockensis* (Gravier), p 380

369. *Axiothella obockensis* (Gravier) (Fig 197, a-e).

*Axiothea obockensis*, Gravier, 1906, p 206, pl IV, figs 221-222

*Axiothella obockensis*, Fauvel, 1930a, p 51, fig 14, a-e, 1932, p 202

Long oval, slanting, cephalic plate, with a smooth rim, a long keel and two parallel nuchal grooves. Ocelli present. Two ante-anal achaetous segments. Anal funnel with a long ventral cirrus. A ventral row of numerous small hooks on the first setigerous segment. Long slender bipinnate setae absent.

*Length:* 10-45 mm.

**Occurrence** Gulf of Mannar, Krusadai Island, Kilarai.

**Distribution** India, Red Sea

**370 *Axiothella australis* Augener (Fig 197, f, g).**

*Axiothella australis*, Augener, 1914, p 65, pl I, figs 7—8, Fauvel, 1930a, p 52, fig 14, f—g

*Axiotheca*, spec., Gravely, 1927, p 26

Body of 18 setigerous segments, two achaetous ante-anals Cephalic plate oval, slanting, relatively short, rim crenulate or notched, a long keel, two straight nuchal

Fig 197—*Axiothella obockensis* (Gravier) a, b, anterior region dorsal and side views  $\times 9$ , c, posterior region, ventral side  $\times 9$ , d, e, hooks from the first setigerous segments  $\times 550$  *A. australis* Augener f, hook from the first segment  $\times 550$ , g, hook from the 10th segment  $\times 550$

organs Anal funnel with alternating cirri, no longer ventral cirrus Hooks of the first segment less numerous, with strongly curved manubrium. Long slender bipinnate setae present

*Length* 19–40 mm by 2 mm

*Occurrence* Gulf of Mannar, Krusadai Island, in a colony of *Polydora caeca*, and a number of specimens with *Mesochaetopterus*

*Distribution* South Australia, India

### Genus MALDANE Grube

Cephalic keel convex, arched, rim divided into three parts by two deep lateral notches. Nuchal grooves short. Anal plate oval, slanting, with the rim notched on each side. Anus dorsal, ante-anal segments achaetous. Anterior segments without collar. Ventral setae absent on the first segment. Dorsal setae of three kinds. Uncini from the second setigerous segment. Glandular belts. Tube coated with mud.

#### 371. *Maldane sarsi* Malmgren. (Fig 198, a–i)

*Maldane sarsi*, Arwidsson, 1906, p 151, pl VII, figs 192–199. Fauvel, 1927a, p 197, fig 69, a–i, 1932, p 202. Monro, 1937, p 307. Augener, 1927a, p 227. Mesnil and Fauvel, 1939, p 14, figs 9, 10.

(?) *Maldane cristata* Treadwell, Monro, 1937, p 306, fig 23

Fig 198—*Maldane sarsi* Malmgren. a, anterior part, side view  $\times 3$ , b, head, from above  $\times 4$ , c, d, posterior part, side and ventral view  $\times 3$ , e, f, hook, side and front view  $\times 330$ , g, winged kneed seta  $\times 330$ , h, straight winged seta  $\times 330$ , i, part of a spinous bristle  $\times 390$ .

Body of 19 setigerous segments, two achaetous ante-anals. Cephalic keel strongly arched. Rim smooth but notched on each side. Nuchal grooves short, diverging, straight or faintly curved. Anal plate oval, slanting, with the rim notched on each side, smooth or faintly crenate on the ventral side. Anus dorsal, puckered under the anal plate border. No acicular hooks on the anterior segments. Uncini with a strong hooked end. Numerous denticles on the vertex, and sub-rostral filaments. A thick tube of mud.

*Length* 50–120 mm. by 2–3 mm

*Colour* Anterior part more or less spotted with brown marks

*Occurrence* Andaman Sea, Bay of Bengal; Laccadive Sea, Arabian Sea, Gulf of Oman

*Distribution* Pacific Ocean, California, Japan, Australia, Malayan Seas, Indian Ocean, Atlantic Ocean, North Sea, Antarctic Ocean

*Remarks* The variety *tropica* Monro differs only from the type in the absence of a glandular crescent on the dorsal surface of the 5th setigerous segment, but that is also sometimes absent in specimens of *M. sarsi* from the north seas. *Maldane cristata* Treadwell has a high keel, a deep cephalic pouch and a denticulate ventral border of the anal plate, but these characters are also frequently met with in typical *M. sarsi*, the anal plate being very variable. Moreover, the cephalic pouch is always present, more or less deep but often inconspicuous, its anterior dorsal edge being appressed on the head, especially on specimens dead in their tubes.

### Genus MALDANELLA McIntosh

A rimmed cephalic plate. Nuchal grooves straight, parallel. Anal funnel fringed with cirri, with anus at the bottom. Ventral setae and hooks absent on the first setigerous segment. Uncini from the 2nd setigerous segment. Anterior segments short, *collarless*. Glandular belts on the first 7 segments.

#### 372. *Maldanella harai* (Izuka) (Fig 199, 1–n)

*Maldanella harai*, Fauvel, 1914b, p. 260, pl. XXIII, fig. 1, 1927a, p. 186, fig. 64, 1–n (Synonymy), 1932, p. 203

*Glymene harai*, Izuka, 1902, p. 111, pl. III, figs. 9–12

*Axiiothea campanulata*, Moore, 1903, p. 485, pl. XXVII, fig. 99, 1906, p. 239

Prostomium eyeless Cephalic plate slanting, with a smooth rim faintly, or not, notched Keel and nuchal grooves extending to about half the length of the plate 19 setigerous segments and 2 achaetous ante-anals Anterior border of the first 7 setigerous segments glandular Dorsal setae of two kinds (1) winged, and (2) slender,

Fig 199—*Petaloproctus terricola* Quatrefages a, anterior part  $\times 25$ , b, head from above, c, posterior part, dorsal view  $\times 25$ , d, posterior part, side view  $\times 25$ , e, ventral hook  $\times 120$ , f, anterior acicular hook  $\times 24$ , g, winged bristle  $\times 120$ , h, part of a penate bristle  $\times 400$  *Maldanella harai* (Izuka) i, head, side view, k, anterior part  $\times 2$ , l, posterior region  $\times 2$  (after Izuka), m, ventral hook  $\times 120$ , n, head, from above  $\times 4$

smooth capillaries Uncini from the 2nd setigerous segment. Anal funnel elongated, fringed with small, nearly equal cirri. Tube of mud.

*Length:* 70–180 mm by 3–6 mm.

*Colour.* Decoloured in spirit

*Occurrence.* Bay of Bengal, 637–800 fms, Laccadive Sea, 1,154 fms.

*Distribution.* Japan, Bay of Bengal, Laccadive Sea, Atlantic Ocean

### Genus PETALOPROCTUS Quatrefages.

Head arched, without cephalic plate Nuchal grooves short. A large anal foliaceous plate, without cirri, surrounding the anus. Ventral acicular bristle on the first

three segments Anterior segments short, middle ones more elongated, posterior ones shorter, with a dorsal fleshy lobe Achaetous ante-anals rudimentary Glandular belts on the anterior segments Hard, thick tube of concrete sand

373 *Petaloproctus terricola* Quatrefages (Fig 199, a—h).

*Petaloproctus terricola*, Fauvel, 1927a, p 194, fig 68, a—i, (Synonymy), 1932, p 203

*Maldane cristagalli*, Claparède, 1868, p 457, pl XXVI, fig 4

Head rounded, without any trace of rim Keel arched Nuchal grooves short and diverging 22 setigerous segments, achaetous ante-anals wanting A large ventral spine on the first three setigerous segments Dorsal setae of three kinds (1) winged, (2) slender capillaries, (3) long, slender, filiform, barbed threads A large raised fleshy pad ending backwards in a blunt lobe on the dorsal side of the last 6—7 segments Last segment very short Tube thick, hard, sandy

*Length* 150—200 mm by 3—4 mm

*Colour* Anterior part red, spotted white, 2nd—3rd segment pink, the next four red-brown with clear belts Posterior region dark

*Occurrence.* Koweit Harbour

*Distribution* Malay Seas, Indian Ocean, Persian Gulf, Atlantic Ocean, Mediterranean Sea

### Genus ASYCHIS Kinberg

Cephalic plate, rim divided into three parts by two deep lateral notches Keel flat and short Nuchal grooves curved Anus dorsal, above the large oval foliaceous, more or less lobed, plate First ventral setigerous segment without ventral setae or hooks Uncini from the 2nd setigerous segment Anterior segments short Achaetous ante-anals short, rudimentary Dorsal setae of three kinds

#### *Key to the species of Asychis*

1 Anal plate with long filiform processes, simple or forked 2

Anal plate without filiform processes 3

2 Anal plate with 3 long filiform processes, simple or forked  
Lateral sides of the cephalic plate smooth .

*trifilosa* Augener, p. 388

- Anal plate with several sharp slender processes. Cephalic plate denticulate *gotoi* (Izuka), p 387
- 3 Anal plate foliaceous, dorsal part broad, with triangular, in-rolled, lateral lobes, ventral part bilobed, smooth, *gangeticus* Fauvel, p 389
- Anal plate with dorsal and ventral lobes smooth or denticulate
- 4 Cephalic plate rim smooth *theodori* Augener, p. 386
- Cephalic rim denticulate *disparidentata* (Moore), p 387.

374 *Asychis theodori* Augener (Fig 200, c—f)  
*Asychis theodori*, Augener, 1926a, p 183, fig 6 Fauvel, 1932, p 204

Cephalic plate rim divided into three smooth lobes by the deep lateral notches First segment achaetous,

Fig 200—*Asychis gotoi* (Izuka) a, anterior part, side view  $\times 16$ ; b, anal funnel, side view  $\times 10$  *A. theodori* Augener c, head, from above  $\times 14$ , d, anal plate  $\times 14$ , e, collar, ventral view  $\times 14$ , f, ventral hook from 2nd foot  $\times 450$  (after Augener).

with anterior border drawn out into a collar notched on each side and in the middle of the ventral lobe 19 setigerous segments and two achaetous ante-anals Dorsal lobe of the rounded anal plate smooth, ventral lobe bluntly denticulated.

*Length* 54 mm. by 15 mm

*Colour* greenish ochraceous

*Occurrence* Persian Gulf, 25 fms.

*Distribution* New Zealand, Persian Gulf

**375. *Asychis gotoi* (Izuka) (Fig 200, a—b)**

*Asychis gotoi*, Fauvel, 1932, p 205, 1934, p 57, figs 2—3, 1939, p 16, fig 11 Mesnil and Fauvel, 1940, p 22

*Maldane gotoi*, Izuka, 1902, p 109, pl III, figs 1—8

*Maldane coronata*, Moore, 1903, p 483

Rim of the cephalic plate divided into three lobes by deep lateral notches dorsal lobe serrated, lateral lobes fringed with cilia of unequal lengths First segment produced into a collar notched on each side. 19 setigerous segments No achaetous ante-anals The dorso-posterior margin of the anal plate is expanded into a petaloid plume having six to twelve corners, each of which is prolonged into a long slender cirrus Tube membranous coated with mud

*Length* 80—120 mm by 6 mm

*Occurrence* Andaman Sea, 405 fms, Laccadive Sea, 1,022 fms

*Distribution* Japan, Java, Andaman Sea, Laccadive Sea, Adriatic Sea

**376. *Asychis disparidentata* (Moore).**

*Asychis disparidentata*, Fauvel, 1932, p 205

*Maldane disparidentata*, Moore, 1904, p 494, pl XXXVIII, figs 32—35, 1909, p 282

Cephalic plate broadly oblong, elliptical, frontal ridge low, broad, inconspicuous, equal to one-third of the cephalic plate Nuchal grooves short Posterior lobe of the cephalic rim divided into about 15 low, broad, truncate teeth, irregular and not constant, lateral lobes considerably more elevated and bearing 5 or 6 larger, more prominent, rounded teeth Anterior margin of the first setigerous segment produced into a collar. 19 setigerous segments, an achaetous ante-anal Anal plate with a dorsal lanceolate lobe arched over the anus and a ventral lobe smooth or slightly irregular, but entirely without lobes or processes

*Length:* 40 mm. by 2 mm.

*Occurrence* Cape Comorin, 902 fms

*Distribution:* California, India

*Remarks.* May be a mere variety of *A. biceps*

377 *Asychis trifilosa* Augener (Fig. 201, g-h).

*Asychis trifilosa*, Augener, 1926, p 187, fig 7 Fauvel, 1932, p 205. Mesnil and Fauvel, 1939, p 17, fig 12

Lateral lobes of the cephalic rim smooth, dorsal lobe faintly and finely crenate or smooth First setigerous segment not produced into a collar, but one is present on the

5th 19 setigerous segments; one (?), or none, ante-anal. Anal plate with a dorsal petaloid lobe bearing three very long filiform cirri, simple or forked at the tip, ventral lobe narrow and smooth, forming a hollow cup. Anus dorsal and wrinkled.

*Length.* 160 m. by 4 mm

*Occurrence* Gulf of Oman, in greenish brown mud

*Distribution.* New Zealand, Malay Archipelago, Gulf of Oman.

378 *Asychis gangeticus* Fauvel (Fig 202, a—i)

*Asychis gangeticus*, Fauvel, 1932, p 206, pl VIII, figs 1—9

Body nearly cylindrical, truncate at both ends 19 setigerous segments, achaetous ante-anals absent Cephalic plate rounded, slanting, with a membranous rim divided into three parts by deep lateral notches, posterior and

Fig 202—*Asychis gangeticus* Fauvel a, anterior part, side view  $\times 25$ , b, pygidium, ventral view  $\times 25$ , c anterior end, side view  $\times 4$ , d, pygidium, side view  $\times 4$ , e, pygidium, dorsal view  $\times 4$ , f, head  $\times 4$ , g, barbed seta  $\times 250$ , h, winged seta  $\times 50$ , i, hook  $\times 105$  (Fauvel 1932)

lateral parts smooth, faintly wavy. Prostomium flattened, broadly rounded in front. Keel broad, long and depressed. Nuchal grooves transversely curved. A longitudinal furrow on each side of the achaetous buccal segment. Anterior rim of the first setigerous segment produced into a collar sheathing the buccal segment, deeply notched on either side. Buccal segment and the first three setigerous segments somewhat uniformly glandular, 4th and 6th with broad ventral glandular pads, next with only large, raised, glandular tori. There is no glandular dorsal crescent-shaped pad on the 5th setigerous segment. Dorsal setae of three kinds: (1) long winged setae, slightly bent, (2) slender setae, barbed at the tip and shorter, and (3) very slender smooth capillary setae. On the following segments a transverse row of uncini, whose large fang is crested with a rather large tooth and numerous tiny denticles. The subrostral barbs are few and slender, the manubrium is clearly enlarged. The last two setigerous segments are very short, with raised glandular tori, the last one reaches the base of the caudal funnel. Pygidium with: (1) a broad triangular, foliaceous dorsal lobe with a rounded border, lateral borders rolled inwards, and a dorsal keel ending in a rounded valve above the anus, and (2) a foliaceous ventral lobe divided by a deep indentation into two lateral lobes sheathing the base of the rolled in dorsal lobe. The length of the pygidial apparatus equals that of the last three setigerous segments.

*Length.* 140 mm. by 5–6 mm

*Colour* in spirit yellowish brown with glandular bands and whitish tori.

*Occurrence* Gangetic Delta. A single specimen.

*Incertae sedis*

### NICOMACHE TRUNCATA Willey

*Nicomache truncata* Willey, 1905, p. 290, pl. V, fig. 122–123

As Willey's specimen from Ceylon is only an anterior fragment of 6 segments, in the absence of the posterior end and anal plate it is not possible to decide with any certainty whether it belongs to the genus *Nicomache* Malmgren or the genus *Petaloproctus* Quatrefages.

### Family OWENIIDAE Rioja

#### *Ammocharidae* Malmgren

Body cylindrical, anterior segments longer than broad, posterior ones shorter. Prostomium fused with the buc-

cal segment (peristomium), devoid of appendages or ending in a lobed membrane. Dorsal setae capillary, ventral uncini very numerous, very small, set in transverse rows, and with a bent hooked tip. Anal cirri absent. Tube coated with sand or shell fragments.

*Key to the genera of OWENIIDAE*

*Ammonocharaxes orientalis* Grube, Willey, 1905, p. 290, pl. V, figs 124-125.

Uncini with an elongated manubrium and a curved hook with two parallel teeth. The two ante-anal segments without dorsal setae. Tube membranaceous, open and tapering at both ends, coated with overlapping sand grains and flat bits of shells, imbricated.

*Length*. 50-100 mm. by 2-3 mm.

*Colour* in life, greenish or yellowish with paler transverse glandular belts.

*Occurrence*. Mergui Archipelago, S. of Ceylon, 1,500 fms., Tuticorin Pearl Bank.

*Distribution*. Pacific, Indian and Atlantic Oceans. Cosmopolitan.

**Genus MYRIOCHELE Malmgren**

Body slender, cylindrical, divided into two regions. Prostomium devoid of appendages. Mouth oblique, subventral. Peristomium achaetous. First three segments

without uncini Dorsal setae capillary, slender, spinulose  
 Uncini bidentate, Pygidium obtuse-conical. (Fig. 203,  
 g-m).

Fig 203—*Owenia fusiformis* Della Chiaje a, natural size, b, tube, natural size, c, d, head from above, mouth closed or opened, with the labial organ, much enlarged (after Watson), e, dorsal bristle  $\times 300$ , f, uncini, front and side view  $\times 550$ . *Myriochele heeri* Malmgren g, enlarged, h, anterior part, ventral view, i, posterior region, k, dorsal bristle  $\times 470$ , l, m, uncini  $\times 550$  (a species hardly distinct from *M. picta*)

380. *Myriochele picta* Southern (Fig 201, e, f)

*Myriochele picta*, Southern, 1921, p 638, pl XXXI, fig 30

Prostomium and peristomium fused in a rounded eyeless mass Behind the mouth, a clavate diverticulum. The three thoracic segments carry only capillary setae The first abdominal segment is as long as the three thoracic segments, the second is still longer and is the largest of the body. The succeeding eight diminish only slightly in length, but the three posterior are much shorter. Dorsal capillary setae and ventral hooks in all the abdominal segments The hooks are bidentate and arranged in irregular transverse rows Five pairs of thread glands in the first five segments. Tubes cylindrical, covered with small quartz grains.

Length. 3–4 mm

*Colour* on the back of the head, a conspicuous patch of reticulate purplish-brown pigment. A transverse dorsal band at the posterior end of the buccal segment.

*Occurrence* Chilka Lake, on a muddy bottom

### Family SABELLARIIDAE Johnston

#### HERMELLIDAE Auct

Body divided into three regions. Prostomium not conspicuous, between two large opercular stalks bearing modified setae (paleae) set in concentric circles. Two palps. Anterior region of two short segments with rudimentary feet, and 3-4 parathoracic biramous segments with oar-shaped setae, abdominal region with uncinigerous dorsal rami, and ventral rami with capillary setae. Simple gills. A caudal tail-like unsegmented, achaetous and apodous region. Hard, thick, sandy tube.

#### Key to the genera of SABELLARIIDAE

- Two concentric rows of opercular paleae . . . *Pallasia* Quatrefores, p 398
- Three concentric rows of opercular paleae . . . *Sabellaria* Lamarck, p 393

### Genus SABELLARIA Lamarck

Opercular stalks short, each bearing three concentric rows of golden paleae. Two small elongated palps. Numerous filiform tentacles on the ventral side of the opercular stalks. Three biramous parathoracic segments with oar-shaped setae. Dorsal falciform gills. In the abdomen broad dorsal pinnules with pectinate uncini and ventral capillary setae. Tail smooth, achaetous. Thick tube of firmly cemented sand grains.

#### Key to the genera of Sabellaria

- 1 Outer opercular paleae with a slender, elongated, barbed process. Paleae of the middle row cup-shaped, smooth . . . *spinulosa* Leuckart, p 394

## SABELLARIA

and erect. Inner paleae spoon-shaped 2-3 pairs of dorsal acicular bristles. A triangular finger-like cinus between the opercular stalks

Several varieties of this species have been described one of these is found in Indian waters

var *alcocki* Gravier. (Fig. 204, *h-m*).

Middle paleae alternately long and short, erect, or all elongated

Occurrence Mergui Archipelago, Paway Island, Malah River, Gangetic Delta

Distribution Indo-China, Indian Ocean, Persian Gulf, Atlantic Ocean

382 *Sabellaria cementarium* Moore (Fig. 205, *a-g*).  
*Sabellaria cementarium*, Moore, 1906, p 248, pl XII, figs 45-51 Fauvel, 1932, p 209, fig 34

Outer paleae ending in a long slender, sharp, smooth spine arising between shorter, smooth spines Middle paleae short, smooth, spoon-like Inner paleae hollow, elongated, smooth or denticulate along the edge Tube

Fig 205—*Sabellaria cementarium* Moore *a*, outer palea  $\times 65$ , *b*, inner palea  $\times 65$ , *c*, intermediate palea  $\times 65$ , *d*, dorsal interpeduncular hooks  $\times 150$ , *e*, *f*, tips of outer paleae  $\times 150$ , *g*, tip of an inner palea  $\times 150$

very thick, hard, made of large translucent quartz grains firmly cemented together, with an inner diameter of about 3 mm

*Occurrence* Tuticorin beach

*Distribution* Pacific Ocean (Alaska), India

383 *Sabellaria pectinata* Fauvel (Fig. 206, a—g)

*Sabellaria pectinata*, Fauvel, 1928b, p 163, fig 3, a—g, 1930a, p 53, fig 15, 1932, p 210

Outer paleae having broad paddle-shaped tips with a central triangular spike bearing numerous lateral spines. The middle paleae are cup-shaped, with a short smooth

Fig 206 —*Sabellaria pectinata* Fauvel a, outer palea  $\times 62$ , b, c, inner paleae  $\times 78$ , d, intermediate palea  $\times 78$ , e, uncinus  $\times 310$ , f, oar-shaped bristle  $\times 155$ , g, capillary bipectinate bristle  $\times 155$  *Pomatostegus polytrema* Philippi, var *indica* Fauvel h, i, two kinds of operculum, side and front view  $\times 27$

tip Inner paleae elongated, spoon-shaped with spinose edges. A median cirrus between the opercular lobes. Tube of somewhat minute, transparent, sand grains held together by a white cement.

*Length* 10–12 mm, tail not included, by 1–15 mm

*Colour* Pigment spots on the anterior part, buccal tentacles dotted with red-brown.

## SABELLARIA

**Remarks** Differs from *S. spinulosa* Leuckart in the form of its operculum

**Occurrence** Gulf of Mannar, Krusadai, Shingle Island

var *intermedia* Fauvel (Fig 207, a-h)

*Sabellaria pectinata* var *intermedia*, Fauvel, 1932, p 210, fig 35

Opeicular pillars fused along about two-thirds of their length There are a few dorsal acicular bristles and a median cirrus between the opercular lobes The first

Fig 207—*Sabellaria pectinata* Fauvel var *intermedia* Fauvel a, b, c, outer, inner and intermediate paleae, drawn to the same scale  $\times 65$ , d, intermediate elongated palea  $\times 120$ , e, outer palea  $\times 150$ , f, tip of an outer palea, side view  $\times 150$ , g, short intermediate palea  $\times 120$ , h, inner palea  $\times 120$

four or five abdominal segments bear large gills which seem to be absent on the next abdominal segments of the smaller specimens The outer paleae are denticulate and gradually decrease in size but resolve at the tip into a few smooth spines The inner paleae are like those of the typical form, but the middle paleae are either short and broad or elongated, toothed and erect, or alternating

as in *S. spinulosa*, var *alcocki*. The outer paleae are of a type intermediate between those of *S. cementarium* Moore and the typical *S. pectinata* Fauvel.

*Occurrence* Matlah River, Gangetic Delta.

### Genus PALLASIA Quatrefages

Opercular stalks elongated, each bearing two concentric rows of paleae. Dorsal hooks. Grooved, frilled, elongated palps. Numerous filiform tentacles on the ventral side of the opercular stalks. Three or four biramous parathoracic segments with oar-shaped setae. Dorsal filiform gills. Broad dorsal abdominal pinnules with pectinate uncini, ventral capillary setae. Tail smooth, achaeous. Thick tube of firmly cemented sand grains.

#### Key to the subgenera of Pallasia.

Three parathoracic segments  
Outer paleae bent and denticulate,  
inner paleae smooth and slender

*Pallasia* Quatrefages  
s str p 398

Four parathoracic segments Outer paleae smooth

*Lygdamis* Kinberg, p 398

*Pallasia porrecta*, Ehlers, 1908, p 136, pl XVIII, figs 11—15, pl XIX, fig 1—3

*Lygdamis porrectus*, Johansson, 1927, p 86

(?) *Pallasia chrysocephala*, Quatrefages, 1865, p 322

Outer paleae smooth, flat, lanceolate, pointed, inner paleae needle-shaped One pair of brown dorsal hooks Four thoracic segments bearing narrow, oar-shaped, setae with lacinate tips Tube straight, thick-walled, coated with Foraminifera

*Length* More than 25 mm by 4.5 mm.

*Colour.* yellowish white, with brown streaks on the ventral part.

*Occurrence* From West Sumatra, 1280 m Volcanic ooze.

## Family STERNASPIDIDAE Malmgren

Body very short and plump. Prostomium small, without appendages. First three segments armed, each with an incomplete belt of bristles. A pair of sexual papillae on the 7th setigerous segment, next eight segments achaetous. A ventral posterior shield with radiating bristles. A bundle of anal gills.

## Genus STERNASPIS Otto

Body swollen at both ends, segments short and few. Mouth subterminal. Anterior bristles short and stout. Horny shield composed of two trapezoid plates with radiating bundles of capillary setae. Filiform gills set on two posterior plates. Anus terminal.

387. *Sternaspis scutata* (Ranzani) (Fig 210, a-g)

*Sternaspis scutata*, Moore, 1903, p 487 Augener, 1926, p 283  
Fauvel, 1927a, p 216, fig 76, a-g (Synonymy), 1932, p 213,  
1933, p 52

Fig 210—*Sternaspis scutata* (Ranzani) a, ventral view  $\times 4$ , b, branchial plates  $\times 4$ , c, a worn anterior bristle  $\times 52$ ; d, e, anterior bristles with transparent tip  $\times 52$ ; f, tip of a posterior barbed bristle  $\times 130$ , g, posterior smooth capillary bristle  $\times 130$

*Sternaspis fossor*, Stimpson, 1853, p. 29, pl. II, fig. 19

*Sternaspis costata*, Marenzeller, 1879, p. 142, pl. VI, fig. 4 Southern, 1921, p. 649, pl. XX, fig. 5A, 5B

Body sausage-like, narrowed in the middle, expanding at both ends. The anterior segments often retracted into the following ones. Densely coated with small filiform papillae. Prostomium reduced to a mere small knob. Shield plate divided into two unequal parts by a slanting line and marked with ridges and striae.

*Length* 10–30 mm. by 8–10 mm

*Colour.* greyish. Shields purple, violet or red or dark. Gills red.

*Occurrence* Buima, Meigu, Andaman Islands, Chilka Lake, plentiful in mud, Ganjam Coast, Madras.

*Distribution* Pacific Ocean, Japan, Petchili, New Zealand, Australia, Indian Ocean, Atlantic Ocean, Mediterranean Sea, Arctic Seas.

*Remarks* Having had the opportunity to compare specimens of *Sternaspis* from the gulf of Petchili with those of India, Indo-China and Europe, I have failed to find any constant differences between *St. costata* Marenzeller and *St. scutata* Ranzani. The so-called accessory plates of Marenzeller are only the anterior border of the shield plates seen under the more or less transparent skin.

### Family AMPHICTENIDAE Malmgren

Segments few, body short, conical, divided into three regions (1) thoracic, (2) abdominal with biramous segments, and (3) caudal (scapha), very small and leaf-like, with hooks at the base. An operculum of an anterior row of large golden setae (paleae). Two pairs of anterior foliated branchiae. A free, slightly conical tube of sand grains.

#### *Key to the genera of AMPHICTENIDAE*

Antennal veil fringed. A distinct stricture between abdomen and scapha.

*Pectinaria*  
Lamarck, p. 402

Antennal veil smooth. Stricture between abdomen and scapha less distinct.

*Petta* Malmgren

### Genus PECTINARIA Lamarck

Antennal veil fringed. Dorsal cephalic rim smooth or serrate. Uncini from the 4th setigerous segment.

Dorsal setae of two kinds (1) with slender smooth tips, and (2) with serrated tips. Uncini pectinate, with numerous, and often unequal, teeth. Tube free, thin walled, straight or curved.

*Key to the subgenera of Pectinaria*

*Pectinaria antipoda*, Schmarda, 1861, p 46, pl XXIV, fig 199  
Nilson, 1928, p 69, fig 2 Pruvot, 1930, p 78, pl III, figs 93-95  
Fauvel, 1932, p 214  
*Cistenides antipoda*, Augener, 1927, p 231, fig 13

17 setigerous segments and 13 uncinigerous. Achaetous ante-scapal segments absent but the 17th segment has only capillary setae. Dorsal rim of cephalic plate smooth. Antennal veil fringed and funnel shaped above the buccal tentacles. Dorsal setae narrow winged, with a straight smooth tip, or a geniculate spinulose tip. Uncini with 6-7 large decreasing teeth and 2-3 very small ones above the basal gouge-like process. Scapha ovate, with indented edges. Ligule very faintly bilobed, with a very small anal cirrus.

*Length* about 40 mm by 12 mm

*Occurrence* Koweit Harbour, Persian Gulf 31 fms

*Distribution* Australia, New Caledonia, Persian Gulf

Subgenus AMPHICTENE Savigny

389 *Pectinaria* (*Amphictene*) *crassa* Grube. (Fig 211 a-d)

*Pectinaria crassa*, Grube, 1870, p 321 Nilsson, 1928, p 58, fig 18  
Pruvot, 1930, p 80, pl III, fig 89-92 Fauvel, 1932, p 215  
*Amphictene crassa*, Augener, 1926, p 463, fig 9

17 setigerous and 13 uncinigerous segments. Achaetous ante-scapal segments absent. Dorsal rim of the cephalic plate serrated. Antennal veil fringed and funnel-shaped above the buccal tentacles. Dorsal setae winged, with a straight smooth tip, or a geniculate spinulose tip.

Fig 211—*Amphictene crassa* Grube a, anterior part, side view  $\times 15$ , b, scapha, dorsal view  $\times 25$ , c, d, hook, side and front view  $\times 365$ . *Pectinaria antipoda* Schmarda, e, scapha, ventral view enlarged, f, scapha, dorsal view, enlarged, g, hook  $\times 350$  (after Pruvot)

Uncini with two parallel rows each of 6—7 large decreasing teeth and 2—3 very small ones above the basal gouge-like process. Scapha longer than broad, with denticulate edges and small cirriform processes. Semi-circular ligule.

*Length.* 60 mm. by 15 mm.

*Occurrence.* Cochín backwater, near Ernakulam; Trincomalee.

*Distribution.* New Caledonia, Philippine Islands, Andaman Islands, Ceylon, Arabian Sea.

Subgenus **LAGIS** Malmgren390. *Pectinaria (Lagis) abbranchiata* Fauvel (Fig. 212, a-e).

*Pectinaria (Lagis) abbranchiata*, Fauvel, 1932, p. 215, pl. VIII, figs 10-14.

16 setigerous segments with capillary setae, 12 uncini-gerous (from the 4th segment to the 15th) An achae-tous segment in front of the scapha. Antennal veil fring-ed with 15-20 claviform papillae, it is funnel-shaped above

Fig. 212—*Pectinaria (Lagis) abbranchiata* Fauvel a, anterior end, side view  $\times 10$ , b, anterior end, ventral view  $\times 10$ , c, scapha  $\times 14$ , d, uncinus  $\times 1200$ , e, uncinus, front view  $\times 1200$  (from Fauvel 1932)

the buccal tentacular curri and is not bound to the first setigerous segment. Dorsal rim of the cephalic plate smooth. On each side, about 15 stout golden paleae with a very slender rolled-in tip, the inner paleae are shorter and more slender than the others. Two narrow dorsal elongated pads at the back of the third segment. Thoracic ventral shields with transverse glandular pads from the

2nd segment to the 5th, followed by a rounded median patch to the 6th (2nd uncinigerous) *Branchiae absent*  
 Glandular triangular lobes of the 4th segment absent  
 Ventral body walls thin and transparent Dorsal capillary setae narrow winged, some are long, straight, stiff, with a slender, very faintly spinous tip, while others have bent finely serrated tips Uncini pectinate, with several ventral rows of numerous teeth above the large gouge-like lower process The hooks at the base of the scapha, about 10–12, are short, stout and set in a curved row on either side Scapha short and stout, with erect edges bearing short ovate knobs Anal ligule triangular, with a smooth edge and a very small cirrus Tube straight (?), very brittle, made of a single layer of transparent quartz grains held together by a yellowish cement

*Length* 11–17 mm by 3 mm

*Colour* Whitish yellow, in spirit, with golden paleae

*Occurrence* Cochin backwater, near Ernakulam

*Incertae sedis*

- 391 *Pectinaria panava*, Willey, 1905, p 295, pl V, fig 137

The characters given are not even sufficient for a generic identification Ceylon

- 392 *Pectinaria capensis* Gmelin, Quatrefages, 1865, p 334

“Seas of India and Cape of Good Hope”

Family AMPHARETIDAE Malmgren

Body divided into two regions (1) thorax with dorsal capillary setae and ventral uncinigerous pinnules, and (2) abdomen bearing only uncinigerous pinnules Pro-stomium conical or trilobed Buccal tentacles long, smooth or pinnate, *retractile into the mouth* Three or four pairs of subulate, seldom pinnate, gills inserted on the anterior segments and having in front two bundles of paleae, sometimes absent

 Hesse, 1917, p 116  
*Amphicteis japonica*, McIntosh, 1885, p 431, pl XXVIA, figs. 3-5

17 thoracic setigerous and 15 abdominal uncinigerous segments Numerous eye-spots Golden paleae straight or curved at the tips, which are more or less tapering. Gills inserted on the first and second segments in two close-set groups of four each Feet with a clavate papilla at the ventral edge distally Abdominal pinnules with a dorsal short process, the dorsal cirri replace the absent dorsal ramus Uncini with a single row of 4-7 teeth. Tube membranous, coated with mud

*Length* 20-40 mm by 3-5 mm.

*Colour.* in life, pink or yellowish with white dots and brown spots

*Occurrence.* Andaman Islands, 290 fms. off Akyab, Burma; Orissa Coast, Gulf of Oman, 609 fms.

*Distribution.* Japan, Indochina, Bay of Bengal, Gulf of Oman, Atlantic Ocean, Mediterranean Sea, Antarctic Ocean.

394 *Amphicteis posterobranchiata* Fauvel. (Fig. 214, a-e).

*Amphicteis posterobranchiata*, Fauvel, 1932, p 217, pl. IX, figs. 7-11.

17 thoracic setigerous segments with dorsal capillary setae; 13 abdominal segments with uncinigerous pinnules. Prostomium lobed, with a median groove and two diverging glandular ridges. Edge of the nuchal organs raised into a curved pad. Buccal segment as long as the three succeeding segments. Golden-yellow paleae ending in a very slender straight or curved tip, about 20-25 on either side. Eight large subulate gills, the first six disposed in two crowded groups of three, on the first setigerous segment, separated in the middle of the dorsal surface by a

raised rectangular cushion. The fourth pair is set far back from the first three on the third setigerous segment. Uncinigerous pinnules commence on the 4th setigerous segment. Dorsal ramus cylindrical, with a small club-shaped cirrus on the last thoracic segments. Capillary setae winged and smooth. Uncinigerous pinnules shaped as a flattened knob, pedunculate and bearing a single

Fig 214—*Amphicteis posterobranchiata* Fauvel a, dorsal view of anterior end  $\times 5$ ; b, dorsal view of anterior end of another specimen  $\times 5$ , c, abdominal pinnules  $\times 8$ , d, thoracic uncinus  $\times 333$ , e, abdominal uncinus  $\times 333$  (from Fauvel)

retrogressive row of *pectiniform uncini* with three large bent teeth. The manubrium has a dorsal spine on which a "soie-tendon" is inserted. In the abdomen, the pinnules are flattened, sub-rectangular, with a very short, dorsal, blunt process. The dorsal cirri, reduced to a pedunculate small knob, persist in place of the setigerous lobes. Two anal cirri. Tube membranaceous coated with mud.

*Length:* up to 42 mm. by 5 mm.

*Colourless*, in spirit.

*Occurrence:* Bay of Bengal, 606–678 fms; off Ceylon, 660 fms.; off Cape Comorin, 670 fms; Arabian Sea, 544 fms.

Genus **AMAGE** Malmgren.

Body rather short Bristled thoracic segments 14 to 17 in number Uncinigerous pinnules commencing on the 4th setigerous segment Uncini subtriangular, pectiniform Prostomium with two ridges Buccal tentacles smooth Three or four pairs of gills. Anal segment with two carri. *Paleae absent.*

395. *Amage bioculata* (Moore) (Fig 215, *d, e*).

*Samytha bioculata*, Moore, 1906, p 253, pl XII, fig 52, 53,

1908, p 350 Hessle, 1917, p 122

*Amage bioculata*, Fauvel, 1932, p 218

17 thoracic setigerous segments. 13–14 abdominal uncinigerous segments. Prostomium quadrate, broader than long. Numerous eye-spots. *Paleae absent.* Four pairs of much crowded, slightly flattened, slender and

Fig 215—*Lanice socialis* (Willey) *a*, anterior part, ventral view tentacles omitted, *b, c*, hooks, front and side view (after Willey) *Amage bioculata* (Moore) *d, e*, hooks  $\times 600$  (after Moore) *Melinopsis dubita* (Hoagland) *f*, anterior part, dorsal view  $\times 5$ , *g*, seta from the 2nd segment  $\times 350$ , *h*, hook  $\times 350$  (after Hoagland)

elongated gills. First foot with a very small tuft of setae. In the abdomen dorsal ramus reduced to a small achaeous papilla, projecting from the dorsal angles of the body. Uncinigerous pinnules are compressed lappets, constricted at the base, apparently lacking cirri. Uncini roughly triangular, bearing 4–5 long, slender, acute, overlapping teeth.

*Length* 9 mm.

*Occurrence.* Off Puri, Orissa, Bay of Bengal, 13 fms

*Distribution.* North Pacific Ocean, Gulf of Georgia, India

### Genus SCHISTOCOMUS Chamberlin

"Like *Phyllocomus* in lacking tentacles and post-branchial spines, in bearing fifteen pairs of fasciae of capillary setae and four pairs of branchiae. It differs from that genus in having the branchiae of two types, one pair being of the ordinary, smooth, simple, subulate form and the other three with the edges divided, two pinnately, bearing two close series of lamellar branches, and one with an essentially single series of branches in the genotype." (Chamberlin).

396. *Schistocomus hiltoni* Chamberlin (Fig 216, a–e).

*Schistocomus hiltoni*, Chamberlin, 1919, p 17 Fauvel, 1932, p. 219, pl VIII, figs 15–19

Body swollen and somewhat abruptly truncate in front, tapering backwards to a slender tail. 15 thoracic setigerous segments, about 32 abdominal uncinigerous segments. Prostomium projecting forwards as a single hood with rounded anterior corners, devoid of ridges and eyes. Buccal segment broad and short, concave dorsally, ventrally with a lower lip closing the mouth. Buccal tentacles absent (?). *Paleae and post-branchial hooks absent.* Four pairs of branchiae of two types. On the first setigerous segment, a pair of outer subulate gills and two inner pinnate gills attached near the middle of the dorsum. On the 2nd and 3rd setigerous segments a broad pinnate gill on each side. On the 5th setigerous segment a transverse, slender, whitish ridge, faintly raised. Uncinigerous pinnules from the 4th setigerous segment; in the thoracic region they bear a small papilla at their upper border; in the abdomen this process becomes cirriform and the dorsal ramus is reduced to a flattened blunt achaeous lobe and a small rounded papilla. The ovate pygidium bears a crown of short cirri. Dorsal capillary setae

winged. Uncini sub-rhomboidal with 6 large curved teeth set in a single vertical row

Fig 216—*Schistocomus hiltoni* Chamberlin. *a*, anterior end, ventral view  $\times 8$ , *b*, anterior end, dorsal view  $\times 8$ , *c*, thoracic uncinus  $\times 500$ ; *d*, pygidium  $\times 12$ , *e*, last thoracic and first abdominal pinnules  $\times 12$  (from Fauvel 1932)

*Length* 24 mm. by 4 mm.

*Colour* light yellow, with brown spots.

*Occurrence.* Madras Coast, 5–10 fms.

*Distribution:* Laguna Bay, California, Madras Coast.

### Genus *MELINOPSIS* McIntosh.

Differs from *Melinna* in the absence of hooks behind the gills and the presence of a dorsal membranous collar

397. *Melinopsis dubita* (Hoagland). (Fig. 215, *f–h*)

*Melinna dubita*, Hoagland, 1920, p 624, pl I, figs 13–16

*Melinopsis dubita*, Fauvel, 1932, p 220

Prostomium ending in a folded upper lip. Buccal segment largely covered by the following one, next four segments forming a collar-like structure with a prominently developed lateral region, extending obliquely from ventral to dorsal surface. First two segments marked by a row of fine setae. Third segment with similar setae ventrally and a delicate tuft of similar, but larger, capillary setae dorsally. Fourth segment with a small prominent tuft of dorsal setae, but without any ventral setae. The succeeding 13 thoracic segments with a conspicuous dorsal, cylindrical, setigerous lobe, bearing winged capillary setae. Uncinigerous pinnules from the 5th setigerous segment. Abdomen with numerous segments bearing only square uncinigerous pinnules without any process. A small dorsal globular knob. Uncini pectinate, with four large teeth above the ligament process. Buccal tentacles of two kinds (1) long, slender, and (2) short, thick, smooth, grooved. Four pairs of gills, stout, tapering, broad and flattened. Tube composed of a tough inner membrane and a very thick outer coating of fine mud, 140 mm long by 8–10 mm and a bore of only 2–3 mm.

*Occurrence* Bay of Bengal 300 fms, Laccadive Sea, 430 fms.

*Distribution:* Mindanao, Philippine Islands; Bay of Bengal, Laccadive Sea

### Genus MELINNA Malmgren

Body long, slender, tapering behind; segments numerous, 50 and more. Prostomium without glandular ridges. Buccal tentacles smooth. Four pairs of long, subulate, fasciculate gills. *Paleae absent*. A pair of large hooked spines behind the gills. A dorsal transverse membrane on the 6th segment. Segments 2 to 6 coalesced in the form of a vagina partly ensheathing the mouth and the sides of the branchiae and bearing a ventral row of very fine setae. Uncinigerous pinnules from the 7th segment. Dorsal capillary setae winged. Uncini subtriangular, with a few teeth.

#### 398. *Melinna aberrans* Fauvel. (Fig. 217, a–f)

*Melinna aberrans*, Fauvel, 1932, p. 221, pl. IX, figs. 21–26

14 thoracic setigerous segments with dorsal capillary setae (first foot very small, rudimentary). At least 30 abdominal uncinigerous segments. Body slender, greatly tapering posteriorly. Prostomium broad, short, anterior border faintly lobed, without glandular ridges, and bear-

ing, on either side, a transverse row of many eye-spots. Buccal segment partly sheathed into the next, which forms a ventral collar deeply notched in the middle. Buccal tentacles stout, smooth and few. Eight elongated, subulate, ringed gills crowded into two groups and bound together by a membrane reaching up to a third of their length, in each group they are fasciculate at the base.

Fig. 217—*Melinna aberrans* Fauvel. *a*, anterior end, side view  $\times 12$ , *b*, anterior end, dorsal view  $\times 12$ , *c*, anterior end, ventral view, tentacle and gills cut short  $\times 12$ , *d*, small ventral seta from anterior segments  $\times 500$ , *e*, postbranchial hook  $\times 200$ , *f*, uncinus  $\times 700$  (from Fauvel 1932).

Segments 2 to 5 form a long groove, the lateral edges of which are raised up, and united behind the gills by a transverse membrane, the anterior margin of the membrane is convex and smooth. Segments 2, 3, and 5 bear a transverse row of very fine, sharp, wingless ventral setae. There is also a small bundle of dorsal capillary winged setae on the 5th segment. The 4th segment bears, on either side behind the gills, a large bent hook. On the 6th segment there is a small tuft of dorsal capillary wing-

ed setae, but ventral setae are absent. The next 12 segments bear dorsal capillary winged setae and uncinigerous tori. Uncini with a single row of 5 teeth. In the abdomen the uncinigerous pinnules are rectangular and devoid of cuniform processes. Tube membranous, cylindrical, coated with a thick layer of fine mud and sand.

*Length* about 20 mm. by 1 mm.

*Colourless*, in spirit

*Occurrence* Vizagapatam Harbour and Channel connecting backwater with the sea

### Family TERESELLIDAE Grube.

Body divided into thorax, with dorsal capillary setae and uncinigerous tori, and abdomen, generally devoid of dorsal setae but bearing uncinigerous pinnules. Prostomium bearing filiform grooved tentacles, not retractile into the mouth. Branchiae ramosae, rarely filiform or subulate, 1 to 3 pairs (or none) inserted on segments 2, 3 and 4. Paleae absent. Dorsal capillary setae generally winged, with smooth or spinulose tip. Uncini avicular or pectiniform. Ventral glandular scutes or shields in the thorax. Membranaceous tube coated with sand.

### Subfamily AMPHITRITINAE Malmgren

Branchiae bushy, rarely cirriform, or wanting Dorsal setae smooth or serrated, thoracic uncini in double rows.

### Genus LOIMIA Malmgren

Seven thoracic bristled segments Three pairs of arborescent gills. First segments with lateral lobes Dorsal capillary setae winged, smooth at the tip Uncini pectinate, *opposed back to back*, in double rows from the 7th to the 17th thoracic setigerous segments Statocysts in the second segment

#### 399. *Loimia medusa* (Savigny) (Fig. 218, a-f).

*Loimia medusa*, Malmgren, 1865, p 380, pl XXV, fig 80 Willey, 1905, p 302, pl VI, figs 155-159 Fauvel, 1914a, p 145, pl VII, figs 6-9, 1932, p 224, 1935, p 543 Augener, 1926, p 465 Gravely, 1927, p 25

*Loimia annulifilis* Grube, Willey, 1905, p 301, pl VI, figs 153, 154 Gravely, 1927, p 25 Augener, 1927d, p 142

*Loimia montagu* Grube, Willey, 1905, p 303, pl VI, figs 160-163

*Loimia crassifilis* Grube, Willey, 1905, p 302. Michaelsen, 1892, p 20

*Loimia variegata* Grube, Willey, 1905, p 304 Augener, 1926, p 466, fig 10

Thoracic region swollen, abdomen long and slender A large rounded foliaceous arched lip over the mouth Lateral lobes of the first segments large and foliaceous 3 pairs of subequal gills with numerous, slender, branches The uncini are flat pectinate plates with 4-5 long curved

teeth set in a single row. Capillary dorsal setae winged, with a smooth tip, on 17 thoracic segments. About 9–10 ventral shields. Tube membranous coated with sand and debris.

Fig 218—*Loimia medusa* (Savigny) a, ventral view  $\times 8$ , b, abdominal hook  $\times 440$ , c, d, thoracic hooks  $\times 440$ , e, abdominal hook  $\times 440$ ; f, hook, front view  $\times 440$

**Remarks.** *Loimia annulifilis* Grube is only a colour variety often met with, the tentacles of which are ringed, with purple bands. *L. crassifilis* Grube, *L. montagu* Grube, *L. variegata* Grube are only varieties. The number of teeth of the uncini is not characteristic for it varies with age, size and wear.

**Length.** 60–120 mm by 6–10 mm

**Colour** in life variable, grey or yellowish with dark brown transverse thoracic bands and a dark streak under the tori. Ventral shields red.

**Occurrence:** Burma, Andaman Islands; Bay of Bengal, Ceylon, Gulf of Mannar.

*Distribution* Pacific Ocean, California, Japan, Indochina, Indian Ocean, Persian Gulf, Red Sea, Atlantic Ocean.

Genus **LANICE** Malmgren.

17 setigerous thoracic segments, 3 pairs of arborescent gills. Lateral lobes on the first segments. Ventral scutes more or less fused. Dorsal capillary setae winged, with a smooth tip. *Uncini* avicular with transverse rows of denticles on the vertex they are *opposed back to back*, in double rows, on a number of thoracic tori. Tube coated with sand.

400. *Lanice socialis* (Willey). (Fig. 215, a-c).

*Polymnia socialis*, Willey, 1905, p. 299, pl. VI, figs 146-148

Dorsal surface smooth and convex. The first segment, which forms the lower lip, is long below and deeply cleft, the right half slightly overlapping the left. Lateral lobe of the 2nd segment is a semi-lunar, symmetrical, free dermal fold. The band of ventral scutes, rounded in front, attenuate behind, ends, as a white streak, in the region of the 13th-14th tori. Dorsal setae narrowly limbate, with a smooth tip. Thoracic *uncini* uniserial in the first six tori, biserial and *opposed back to back* in the rest, uniserial again in the abdominal pinnules. The *uncini* are avicular with a number of denticulations arranged in arcs across the vertex. Narrow, sand encrusted, tubes.

*Length:* 20 mm by 2 mm.

*Occurrence* Ceylon, Galle; 16-30 fms

*Remarks* This species is very closely allied to *L. conchilega* (Pallas) of Europe.

Genus **POLYMNIA** Malmgren

Generally 17 thoracic setigerous segments. Eye-spots numerous. Three pairs of arborescent gills arising from a main stem. Lateral lobes in anterior segments. Well marked ventral scutes. Dorsal capillary setae smooth at the tip, they commence on the third gill-bearing segment. *Uncini* with an elongated base, a lateral spur and denticles above the main fang; they are set in biserial rows on a number of thoracic segments.

## POLYMNIA

401. *Polymnia nebulosa* (Montagu) (Fig 219, a-g)  
*Polymnia nebulosa*, Fauvel, 1917, p 267, figs 28, 1927a, p 257,  
 fig 89, 1930a, p 55, 1932, p 224  
*Polymnia triplicata*, Willey, 1905, p 300, pl VI, figs 149-154  
*Polymnia trigonostoma*, Augener, 1914, p 80

Body plump, soft, very brittle 17 thoracic segments  
 A raised cephalic ridge, with very numerous, small eye-  
 spots Upper lip well developed Buccal segment collar  
 shaped Oval lateral lobes on segments 2-3 Ventral  
 scutes wrinkled Three pairs of gills with a sub-dichoto-

Fig 219—*Polymnia nebulosa* (Montagu) a, anterior part  $\times 4$ , b,  
 capillary bristle  $\times 150$ , c, uncinus from the 2nd segment  $\times 400$ ;  
 d, double row  $\times 150$ , e, f, uncini from a double row, front and  
 side view  $\times 400$ , g, abdominal uncinus  $\times 400$

mously divided large stem Nephridial papillae from 3rd  
 to 8th segment Uncini with an elongated convex base,  
 a process for a ligament, a main fang, two large teeth and  
 1-5 small denticles on the vertex. Tube of shell frag-  
 ments and debris  
 Length 5-150 mm. by 3-8 mm

*Colour.* in life orange grey, pink or brown, with small white dots. Uncoloured in spirit

*Occurrence* Gulf of Mannar, Pamban Island, Ceylon, Andaman Islands, Maldives, Nicobars

*Distribution.* Pacific Ocean, Indian Ocean, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea

### Genus NICOLEA Malmgren.

15–25 thoracic setigerous segments Eyes present Two pairs of ramose gills The first segments do not show lateral lobes Ventral scutes Dorsal capillary setae smooth at the tip Uncini from the 2nd setigerous segment, they are aviculari with transverse rows of denticles on the vertex and are set in uniserial, alternate or semi-opposite, rows on a number of thoracic segments Tube membranous, coated with sand.

#### 402. *Nicolea gracilibranchis* (Grube) (Fig 220, d).

*Nicolea gracilibranchis*, Marenzeller, 1884, p 207, pl II, fig 2.

Hessle, 1917, p 173 Fauvel, 1930a, p 56, 1932, p 295

*Terebella gracilibranchis*, Grube, 1878, p 230, pl XII, fig 6

Two pairs of gills. 17 thoracic setigerous segments with smooth capillary setae and very projecting abdominal pinnules, whose uncini are bidentate above the main fang The eyes are hidden under the cephalic folds The posterior lip is bilobed The anterior segments have not lateral lobes There are 14–15 ventral scutes On the segment before the first setigerous lies a small papilla behind the second gill Nephridial papillae are conspicuous on the 3rd and 4th setigerous segments.

*Length* 70 mm.

*Occurrence* Singapore, Madras Coast, Gulf of Mannar, Tuticorin, Pamban

*Distribution* Hawaii, Japan, Philippine Islands; India

### Genus TEREBELLA Linnaeus.

Dorsal capillary setae on a very large number of segments, commencing on the 4th segment (3rd gill-bearing), they are winged, with a serrated tip and often of two kinds 2 or 3 pairs of arborescent gills Lateral lobes on the first segment absent Ventral scutes Uncini from the 2nd setigerous segment, set in biserial opposite rows on a large number of segments

403 *Terebella ehrenbergi* Grube. (Fig 220, a-c).

*Terebella ehrenbergi*, Grube, 1870, p 511. Gravier, 1906, p 213, pl. IV, fig 224-225. Hesse, 1917, p 188. Fauvel, 1930a, p 55, 1932, p 226; 1939, p 553

*Leprea ehrenbergi*, Marenzeller, 1884, p 201, pl I, fig 3

*Leprea inversa*, Willey, 1905, p 297, pl VI, figs 141-142, pl VII fig 197.

Eyes conspicuous. Three pairs of gills 13 ventral scutes. The dorsal setae are absent in the last segments. Posterior bristles with broadly winged tips minutely pectinate and spirally twisted. Uncini biserial with 2-3

Fig 220—*Terebella ehrenbergi* Grube a, gill, b, dorsal capillary bristles, c, hooks, side and front view (after Gravier) *Nicolea gracilibranchis* (Grube) d, thoracic hook (after Marenzeller)

main teeth above the fang and 2-3 rows of small denticles. Nephridial papillae long on segments 3, 6, 7 and 8, short and little conspicuous on segments 9, 10, 11 and 12. The nephridial papilla between the 1st and 2nd pair of gills is long and erect

*Length.* 30—40 mm by 25 mm

*Colour.* in life, pink tentacles with pigment streaks or annular bands.

*Occurrence* Diamond Island, Burma, Port Blau, Andaman Islands, Gulf of Mannar, Krusadai, Pamban, Rameswaram, Kilakarai.

*Distribution.* Japan, China Sea, Andaman Sea, Gulf of Mannar, Red Sea.

### Genus *PISTA* Malmgren.

Thorax with 15—17 setigerous segments. Eyes sometimes present. One, two, or three pairs of bushy gills with a stout main stem. Lateral lobes often very conspicuous on the first segments. Distinct ventral scutes. Dorsal capillary setae with a smooth tip (very exceptionally serrated). Uncini from the 2nd setigerous segment, *those of the first segments with a long process or shaft*

#### *Key to the species of Pista.*

#### 404. *Pista indica* Fauvel. (Fig. 221, *a—d*).

*Pista indica*, Fauvel, 1940, p fig 1

Body rather short and plump, abdomen cylindrical, with numerous short segments crowded together. 16

thoracic setigerous segments Prostomium with an eyeless lobe bearing long, and rather thick, grooved tentacles Buccal segment expanded into a dorsal arched lip Obsolete lateral lobes on segments 2 and 3 8-9 ventral scutes. Three pairs of bushy gills, all about the same size. Pygidium without papillae. Dorsal setae capillary with narrow wings and a *finely serrated tip*. Uncini from the 2nd setigerous segment The first four uncinigerous tori

Fig 221—*Pista indica* Fauvel a, anterior part, side view, tentacles cut off  $\times 10$ , b, thoracic bristle  $\times 400$ , c, thoracic hooks  $\times 160$ , d, uncini  $\times 520$

short, with a transverse row of *big, long, brown hooks* with smooth tips On the two following tori a single row of small avicular uncini, next, the succeeding thoracic and abdominal segments bear two alternating rows

*Length* 15-20 mm by 2-2.5 mm

*Decoloured*, in spirit.

*Occurrence* West Narrakal, Cochin State, Chepparam, Cheriya Kamakakudi, Ernakulam Backwater (17 specimens)

*Remarks* With the exception of the serrated dorsal setae all the characters are those of the genus *Pista*

405. *Pista typha* Grube (Fig 222, a—c)

*Pista typha*, Caullery, 1915, p 77 Hessle, 1917, p 155 Augener, 1927a, p 154, fig 17 Fauvel, 1932, p 226, fig 36

*Terebella (Pista) typha*, Grube, 1878, p 232, pl XII, fig 4

17 thoracic setigerous segments Two pairs of unequal gills with a long stem and an oval whorled tuft of filaments Semicircular lateral lobes on the 2nd and 3rd

Fig 222 —*Pista typha* Grube a, hook from the 2nd uncinigerous segment  $\times 500$ , b, hook from the 7th setigerous segment  $\times 500$ , c, abdominal hook  $\times 500$

segments Uncini of the first segments with a long and slender basal shaft Rather long nephridial papillae are conspicuous on the 3rd and 4th setigerous segments

*Length.* 45 mm

*Occurrence* Bay of Bengal, Sandheads, Gangetic Delta, Laccadive Sea

*Distribution* Japan, Philippine Islands, Malayan Seas, South Australia, Bay of Bengal, Laccadive Sea

406. *Pista robustiseta* Caullery (Fig 223, a—e)

*Pista robustiseta*, Caullery, 1915, p 71, fig 1A Hessle, 1917, p 159 Fauvel, 1932, p 227, fig 37

17 thoracic setigerous segments Eye-spots present Two pairs of arborescent gills with stout stems Conspicuous lateral lobes on the first three segments Uncini of the first segments with a stout, broad and long shaft, becoming more slender in the following ones About 14–19 ventral scutes,

*Length.* 20–30 mm

*Occurrence* Gulf of Oman, 609 fms

*Distribution* Japan; Malayan Sea, Gulf of Oman

Fig 223—*Pista robustiseta* Caullery *a, b*, hooks from the first uncini-gerous segment  $\times 210$ , *c*, hook from the 3rd uncini-gerous segment  $\times 210$ , *d*, thoracic hook  $\times 210$ , *e*, abdominal hook  $\times 210$

407. *Pista fasciata* (Grube). (Fig 224, *a–d*)

*Pista fasciata*, Marenzeller, 1884, p 202, pl I, fig 4 Fauvel, 1932, p 228, fig 38

*Terebella (Physelia) fasciata*, Grube, 1869, p 513

*Terebella fasciata*, Ehlers, 1908, p 148

17 thoracic setigerous segments. Two pairs of densely arborescent gills with stout stems. Lateral lobes very large on the buccal segment, which forms a ventral collar notched in the middle. Lobes of the 2nd segment very short. 15–17 ventral scutes. Uncini of all the thoracic segments with a long, rather slender process. The 3rd segment bears a small dorsal papilla on either side. The nephridial papillae on the 3rd and 4th segments lie above and slightly behind the foot.

*Length.* 60–80 mm. by 3–5 mm.

F 56

*Occurrence* Bay of Bengal, 112–168 fms.

*Distribution.* Japan; Bay of Bengal, Red Sea, Zanzibar, Algoa Bay.

Fig 224—*Pista fasciata* (Grube) *a*, hook from the 2nd uncinigerous segment  $\times 380$ , *b*, hook from the 3rd uncinigerous segment  $\times 380$ , *c*, hook from the 11th uncinigerous segment  $\times 380$ , *d*, abdominal hook  $\times 380$

408. *Pista macrolobata* Hessle. (Fig 225, *a–d*).

*Pista macrolobata*, Hessle, 1917, p 157, pl II, figs 4, 36, Fauvel, 1932, p 229, fig. 39

17 thoracic setigerous segments Eyes absent Two pairs of arborescent gills Large lateral lobes on the buccal segment sheathing the head Lateral lobes on the 3rd and 4th, none on the 2nd 17–20 rectangular ventral scutes All the thoracic uncini avicular, with very slender processes Nephridia in 3rd, 6th and 7th segments. Abdominal pinules elongated, rectangular and protruding.

*Length:* 70 mm by 4–5 mm.

*Occurrence.* Tor, Sinai Peninsula.

*Distribution* Japan ; Red Sea

Fig 225—*Pista macrolobata* Hesse a, hook from the first uncinigerous segment  $\times 380$ , b, hook from the 2nd uncinigerous segment  $\times 380$ , c, hook from the 15th uncinigerous segment  $\times 380$ , d, abdominal hook  $\times 380$

409. *Pista herpini* Fauvel (Fig 226, a—h)

*Pista herpini*, Fauvel, 1928, p 160, fig 2, a—h, 1930a, p 57, fig 16, a—h, 1932, p 230

Body narrow, slender, elongate, slightly swollen anteriorly 17 thoracic setigerous segments. Prostomium large, without lateral folds Eye-spots absent Buccal segment expanded into two rounded lobes encompassing the prostomium and united ventrally by a fold ending in a notched lower lip Second segment short, with a ventral transverse ridge, but without marked lateral lobes On the 3rd segment two large, flattened, rounded lobes pointing forwards, or bent backwards There are no lobes on the 4th segment (first setigerous) The 15—17 ventral shields are somewhat fused with the tori Two pairs of branchiae, which may be either bushy or divided on a single plane, they are often borne on long stalks, the first pair being the larger Nephridial papillae inconspicuous. Pygidium with terminal anus surrounded by short papillae Dorsal setae capillary, broadly winged at the end, with a short smooth tip The uncini are in a single row on the first six uncinigerous segments, double-alternating in the ten following (from the 7th to the 16th) uncinigerous or to the last thoracic (17th setigerous), behind that in a single

row Uncini avicular with a broad base, a small ligament, a transverse row of 3–5 teeth and 2–3 rows of small denticles above the main fang The uncini of the first two uncinigerous segments have a long narrow, faintly chitinised

Fig 226—*Pista herpini* Fauvel a, b, anterior region, ventral and side view  $\times 6$ , c, d, capillary setae  $\times 160$ , e, f, uncini from the first uncinigerous segment  $\times 320$ , g, h, thoracic uncini, front and side view  $\times 320$  *Lysilla pambanensis* Fauvel i, ventral side, contracted, most of the tentacular cirri fallen off  $\times 6$ , j, anterior region, ventral side, much swollen, showing nephridia through the integument  $\times 16$ , k, l, posterior region  $\times 6$

process Tendinous processes (*soies de soutien*) in the abdominal tori, which are rectangular pinnules standing out boldly Tube membranaceous, cylindrical, with a coating of sand, fragments of shells and algae

*Length* 10–15 mm. by 2 mm

*Colour* Tentacular cirri white

*Occurrence* Gulf of Mannar, Pamban, Persian Gulf

#### 410. *Pista pachybranchiata* Fauvel (Fig 227, a–f)

*Pista pachybranchiata*, Fauvel, 1932, p 231, pl IX, figs 1–6

Body cylindrical, not swollen anteriorly, abdomen very long 17 thoracic setigerous segments Prostomium rather small, without lateral folds A narrow streak of very small dark eye-spots Buccal segment expanded into two large

rounded lobes encompassing the prostomium. On the 3rd segment, two rounded lobes. There are no lobes on the 4th segment (first setigerous). 15–18 ventral scutes, first rectangular, then hexagonal. Uncinigerous tori rather short. Two pairs of gills with few branches, very thick, subulate, simple or furcate, the second pair is slightly the smaller. Nephridial pores on 3rd, 4th and 5th setigerous segments. Uncini in a single row on the anterior uncin-

fig 227—*Pista pachybranchiata* Fauvel. a, left gill of 2nd pair  $\times 10$ , b, right gill of 2nd pair  $\times 10$ , c, anterior end, ventral view  $\times 5$ , d, uncinus from 2nd uncinigerous segment  $\times 400$ , e, abdominal uncinus  $\times 400$ , f, uncinus from 9th uncinigerous segment  $\times 400$

gerous segments, double-alternating on the succeeding ones of the thorax. Uncini avicular, with a broad base, numerous transverse rows of small teeth above the main fang. They are hardly different from those of the first segments, and have only a very slender, faintly chitinated, basal process. The abdominal tori are small rectangular pinnules. Dorsal setae capillary, long, slender, with a single wing, appearing finely serrated under a high magnification. Pygidium? Tube?

*Length.* 100–120 mm by 4–5 mm, feet not included, 6–6.5 mm if setae included

*Colourless*, in spirit

*Occurrence* Lacadive Sea, 1,150—1,170 fms

*Remarks* This species is an intermediate link between *Amphitrite* O F Muller and *Pista* Malmgren

Subfamily *THELEPINAE* Hessle

Bianchiae filiform Uncini in simple rows

Genus *THELEPUS* Leuckart

Dorsal setae on a large number of segments Two or three pairs of filiform gills, each in a transverse series Numerous eye-spots No lateral lobes on the first segments Uncini commence on the 3rd *setigerous segment*, they are always in a single row

*Key to the species of Thelepus*

- |   |   |
|---|---|
| 1 Two pairs of gills  | . <i>cinnamatus</i><br>Fabricius, p 431 |
| Three pairs of gills  | 2                                       |
| 2 Abdomen tapering, pinnules square and projecting  | <i>setosus</i><br>Quatrefages           |
| Abdomen smooth, swollen, abruptly decreasing, pinnules small, lacking in the posterior part of the tail | <i>plagiostoma</i><br>Schmarda, p 430   |

*Remarks* The cosmopolitan *Th setosus* (Quatrefages) has not as yet been recorded from India, but it exists in the Red Sea and in Indochina. It differs chiefly from *plagiostoma* Schmarda in the condition of the posterior part of its abdomen It is next to impossible to distinguish specimens when the tail is wanting, otherwise both species are easily discriminated.

411. *Thelepus plagiostoma* Schmarda (Fig 228, a—f)

*Thelepus plagiostoma* Schmarda, Augener, 1914, p 95 (*Synonymy*) 1926a, p 239 Fauvel, 1919, p 455, fig 10, 1932, p 233

*Thelepus japonicus*, Marenzeller, 1884, p 12, pl II, fig 4

*Thelepus crispus*, Johnson, 1801, p 428, pl XVII, fig 175—179

Three pairs of filiform gills Posterior part of the body generally swollen, but abruptly tapering to the pygidium Dorsal setae nearly to the end of the body Posterior segments very short, densely crowded, nearly smooth, and lacking uncini Abdominal pinnules small,

not projecting    Uncini with a transverse row of two teeth above the main fang, and a basal knob

*Length*    100–180 mm by 8–10 mm

*Colour*    brown or reddish

Fig 228—*Thelepus plagiotoma* Schmarda    a, b, dorsal bristles  $\times 140$  ;  
c, d, two uncini from one foot  $\times 530$  , e, f, uncini, front view

*Occurrence*    Malacca Strait

*Distribution*    Chile, California, Japan, New Zealand,  
Australia, Indian Ocean

#### 412. *Thelepus cincinnatus* (Fabricius)

*Thelepus cincinnatus*, Hesse, 1917, p 212 Fauvel, 1927a, p 271,  
fig 95, i—m (Synonymy), 1932, p 233, fig 46

Two pairs of filiform gills    Abdomen long, gradually tapering, often coiled    Eye-spots numerous    Ventral scutes indistinct    Dorsal setae sometimes nearly to the end of the body    Abdominal pinnules rectangular, pro-

truding The uncini have, above the main fang, a transverse row of two rather large teeth, a median tooth and often two small denticles The basal knob is more or less enlarged at the tip (variable) Pygidium crenate

*Length.* 100–200 mm by 5–10 mm.

*Colour.* brown, pink or orange-yellow. Gills red

*Occurrence:* Port Blair, Andaman Islands

*Distribution* Japan, Andaman Islands, Atlantic Ocean, Mediterranean Sea.

### Genus STREBLOSOMA Sars

*Grymaea* Malmgren: *Eugrymaea* Verrill.

Two or three pairs of clusters of filiform branchiae Smooth-tipped dorsal setae commencing from the 2nd segment (first branchiferous) and extending to the abdominal region Uncinigerous tori commencing on the 4th setigerous segment. Uncini avicular, uniserial.

#### *Key to the species of Streblosoma.*

Abdominal pinnules sessile	<i>cespitosa</i> Willey, p 433
Abdominal pinnules standing well out	<i>persica</i> Fauvel, p 432

413 *Streblosoma persica* (Fauvel) (Fig 229, Fig. 230, c–m).

*Streblosoma persica*, Fauvel, 1930a, p 58

*Grymaea persica*, Fauvel, 1911, p 419, pl XX, figs 35–43.

Prostomium rounded, with a transverse row of eyes Tentacles few, long, stout, grooved Three pairs of gills, each of numerous simple, coiled filaments Smooth-tipped capillary setae on nearly all the segments First foot on the first branchial segment. Tori from the 4th setigerous segment Uncini avicular, in single rows, retrogressive, with several rows of denticles on the vertex and a knob at the end of the manubrium Abdominal pinnules standing well out. 20–25 ventral biannulate scutes

*Length.* 30–40 mm. by 2–2.5 mm.

*Occurrence* Gulf of Mannar, Krusadar Island, Pamban

*Distribution.* Gulf of Mannar, Persian Gulf.

Fig 229—*Streptosoma persica* (Fauvel) side view  $\times 10$

414. *Streptosoma cespitosa* (Willey) (Fig 230, a, b).

*Gymnaea cespitosa*, Willey, 1905, p 305, pl VII, figs 164, 165,  
Fauvel, 1919, p 457

(?) *Phenacia exilis* Grube, Michaelsen, 1892, p 20

Prostomium with eyes Tentacles stout, plainly grooved Branchial filaments numerous, forming dense coils Dorsal setae narrowly limbate First foot rather large, on the first branchial segment Uncini from the 4th setigerous segment, they are avicular with a button-like knob on the end of the manubrium The thoracic tori gradually insensibly into the abdominal tori which are sessile, not pinnuliform The dorsal capillary setae are absent on the posterior half of the body

*Length.* 30 mm by 3–4 mm.

*Occurrence* Ceylon.

*Distribution* India, Persian Gulf, Red Sea.

Subfamily *POLYGIRRINAE* Malmgren.

Cephalic lobe very large, foliaceous, bearing numerous grooved tentacles *Branchiae absent*. Ventral scutes *paired* and narrow Dorsal setae capillary, smooth or serrated

Genus *POLYCIRRUS* Grube

*Branchiae absent*. Cephalic tentacles very long, very numerous, filiform or swollen at the tips Number of thoracic segments very variable *Uncini* elongated toothed plates, all alike or of two kinds Ventral scutes square, paired Eyes absent Nephridia well developed Circulatory apparatus absent

415 *Polycirrus coccineus* Grube (Fig 230, *n–q*).

*Polycirrus coccineus*, Fauvel, 1919, p 458, pl XI, 1930a, p 59

*Anisocirrus decipiens*, Gravier, 1906, p 225, pl V, figs 235–238

Tentacularia with very numerous, entangled, more or less enlarged at the tip into a tongue-shaped process 16–20 thoracic setigerous segments bearing *boldly serrated bristles* Thoracic uncini on the last thoracic segments, avicularia with a broad short base Abdominal uncini with a narrow elongated base

*Length* 60–80 mm

*Colour* Tentacular cirri yellow

*Occurrence* Gulf of Mannar, Pamban, Kiusadar Island

*Distribution* India, Persian Gulf, Red Sea

### Genus LYSILLA Malmgren

Branchiae absent Dorsal setae capillary, very small  
*Uncini absent*

#### 416. *Lysilla pambanensis* Fauvel (Fig 226, 1–1)

*Lysilla pambanensis*, Fauvel, 1928, p 162, fig 2, 1–1, 1930a, p 59, fig 16, 1–1

Body often much swollen anteriorly, ventral side convex, dorsal concave, posterior region narrow, cylindrical In the anterior region the skin is covered with small papillae, glandular, rounded, hemispherical or flattened and often little conspicuous In the posterior region the superficial rings are often very distinct, even nearly moniliform There are 13–18 thoracic segments bearing dorsal setae A wide, frilled, prostomial lobe, eye-less and bearing numerous tentacular cirri, some cylindrical slender, spially twisted, others much stouter, strongly enlarged at the tip and grooved A prominent upper lip, hollowed, spoon-like A small triangular fleshy knob under the lower lip First segment as a large Y-shaped pad with bent edges The ventral shields are short, narrow, square, sunk into a ventral groove They are not visible when the thoracic region is much swollen Small pointed nephridial papillae on the three first setigerous segments, sometimes on the next seven, a swelling with a small central spot (nephridiopore?) is visible on the base of the foot It appears to have 8–9 pairs of nephridia, the first 4–5 pairs, often visible through the transparent teguments, being short and oval The dorsal capillary setae, very slender and smooth, noticeably emerge from the long cylindrical foot which is slightly enlarged at the tip *Tori and uncini are utterly wanting*, as well in the abdomen as in the thorax Anus terminal, without papillae

*Length* up to 90 mm and more, by 2 mm

*Colour.* in spirit, yellowish-white, more or less closely dotted with rusty brown Tube unknown

*Occurrence:* Pamban, Rameswaram

Subfamily *CANEPHORINAE* Malmgren

A single branchia, quadripartite, pectinated Ventral scutes absent. Dorsal setae smooth or striated Uncini of two kinds.

### Genus *TEREBELLIDES* Sars

Cephalic lobe rounded-ovate with a dense series of grooved tentacles A single dorsal gill with four pectinate divisions Dorsal setae long, tapering and winged Uncini uniserial, of two kinds (1) elongated, acicular, thoracic, (2) pectiniform, abdominal

- Terebellides intoshi*, Caullery, 1915, p. 111, fig. 1  
 (?) *Terebellides sieboldi* Kinberg, Ehlers, 1904, p. 61  
*Aponobranchus perrieri*, Gravier, 1906, p. 232, pl. V, figs. 239–242

Body rather short, 50–60 segments. 18 thoracic setigerous segments. Eyes absent. A single gill, with a stout stem bearing four pectinate lobes with reniform lamellae. It is inserted on segments 3–4. Segments 3 to 6 have, ventrally, a free anterior border. Dorsal setae commence on the 3rd segment. Uncini of the 6th setigerous segment are long, acicular, geniculate, unidentate hooks, those of the next twelve segments end in a blunt tip with small denticles above. Abdominal uncini avicular, with a short base and transverse rows of teeth above the main fang. Abdominal pinnules distinct. Tube membranous, coated with mud.

*Remarks* The peculiar gill assumes very different appearances according to the more or less contracted condition of the organ, depending on preservation or regeneration (it is sometimes easily deciduous).

*Length* 30–60 mm by 2–8 mm

*Occurrence* Banka Strait, Andaman Islands, Off Akyab, Burma, Bay of Bengal, Ganjam Coast, Madras Coast, Laccadive Sea.

*Distribution:* Pacific, Indian and Atlantic Oceans, Mediterranean Sea, Arctic and Sub-Antarctic Oceans.

#### *Incertae sedis*

418. *Polymnia labiata*, Willey, 1905, p. 298, pl. VI, fig. 143–145

The figures of the uncini are more suggestive of a *Pista* than of a *Polymnia* but the description of the unique specimen is too incomplete for an accurate identification.

*Occurrence* Trincomalee Pearl banks

419. *Physelia viridis*, Schmarda, 1861, p. 41, pl. XXV, fig. 201, from Ceylon, is perhaps a *Loimia* (?) .

420. *Neottis gracilis*, Kinberg, 1855

From Singapore is very likely a *Thelepus* or a *Streblosoma*

### Family SABELLIDAE Malmgren

Body somewhat cylindrical or slightly flattened, divided into two regions (1) thoracic consisting of a few segments, with dorsal capillary setae and ventral uncini.

gerous tori, and (2) abdominal, much longer, with dorsal uncinigerous tori and ventral capillary setae. Ventral glandular shields divided by a longitudinal groove. First segment with a more or less developed, entire or notched, collar. Gills forming a funnel surrounding the mouth, they are composed of two semi-circular, or spiral, lobes bearing a number of filaments or radioles, with two rows of barbules. *Operculum absent*. Tube formed of mucus, or membranous, or horny.

*Key to the genera of SABELLIDAE*

*Sabella fusca*, Gravier, 1908, p 71, pl V, figs 243-245 Fauvel, 1927, p 302, fig 104  
*Eurato porifera*, Willey, 1905, p 309, pl VII, figs 1-3

Branchial fan well developed. At the base of the gills four stout, brown, glandular lobes form pads of a very peculiar kind. Body broad and short, bearing between the two divisions of the feet small eye-spots, occasionally wanting.

*Length* 60-80 mm by 7-8 mm

*Colour*. Body pink, gills pale, streaked with brown

*Occurrence* Andaman Islands, Ceylon

*Distribution* Australia, Indian Ocean, Red Sea

#### 422. *Sabella melanostigma* Schmarda (Fig 232, h-n)

- Sabella melanostigma*, Johansson, 1927, p 121 (Synonymy)  
 Fauvel, 1939, p 23, 1940, p

*Sabella guineensis*, Augener, 1918, p 565, pl VII, figs 247-249

Branchial filaments with several pairs of eyes on the dorsal side. Collar low, erect, broadly notched on the dorsal side. The ventral groove is missing or hardly cons-

picuous in the posterior part. A big, dark purple spot above either palapodium. Pickaxe setae very peculiar, ending in a very thin, transparent membrane curved in the shape of a shovel or coal scuttle.

Fig 232—*Sabella porifera* Grube a, b, anterior region, dorsal and ventral view, enlarged, c, pick-axe seta (after Gravier), d, dorsal thoracic bristle  $\times 80$ , e, f, thoracic hook  $\times 160$  *S. melanostigma* Schmarda h, anterior part, dorsal view (after McIntosh), i, thoracic hook  $\times 170$ , k, l, shovel pick-axe setae quarter and front view  $\times 400$ , m, n, thoracic bristles  $\times 120$

**Length** 100–150 mm

**Colour** in life, gills with violet brown stripes. Body greenish, thoracic tori lined with a violet or purple streak.

**Occurrence** Port Blair, Andaman Islands.

**Distribution.** Pacific Ocean, Japan, Malaysia; Andaman Islands, Atlantic Ocean, West Indies, Gulf of Guinea.

### Genus SPIROGRAPHIS Viviani.

Branchial lobes asymmetrical, one semi-circular, the other spirally coiled. Branchial filaments devoid of eyes and dorsal stylodes. Thoracic dorsal setae capillary, winged. Ventral thoracic tori with avicular uncini and pick-axe-shaped setae. Dorsal abdominal uncini avicular, ventral setae capillary, winged. A quadrilobate collar. Tube membranous coated with fine ooze and algae.

423 *Spirographis spallanzanii* Viviani. (Fig 233, a-l)

*Spirographis spallanzanii*, Fauvel, 1927, p 309, fig 105, a-h  
 Johansson, 1927, p 133 (Synonymy)

*Spirographis tricychia*, Schmarda, 1861, p 37, pl XXIII, fig 193

Body cylindrical, abruptly tapering behind Branchial lobes very unequal, one is circular and the other 2-6 times spirally coiled Two short slender grooved palps

Fig 233—*Spirographis spallanzanii* Viviani a, with branchial tuft expanded, b, c, anterior region, dorsal and ventral view  $\times 2$  (after Soulier), d, e, thoracic dorsal bristles  $\times 185$ , f, abdominal capillary bristle  $\times 185$ , g, h, pick-axe setae  $\times 132$ , i, thoracic uncus  $\times 185$ , k, l, abdominal uncini  $\times 185$

Collar with two dorsal lobes and two ventral ones, thick and turned down Pygidium with two small rounded papillae Tube tough, erect

*Length* 200-300 mm by 8-10 mm

*Colour.* very variable Gills more or less streaked  
 Body brown

*Occurrence* Ceylon

*Distribution* Indo-China, Malay Archipelago, Indian Ocean, India, Atlantic Ocean, Mediterranean Sea

Genus **DASYCHONE** Sars

Body short Both branchial lobes equal Dorsal stylodes (appendages) on the branchial filaments, which also bear paired eye-spots Subterminal eyes absent A collar. Pickaxe-shaped setae absent Abdominal dorsal uncini avicular and ventral setae winged

*Key to the species of Dasychone*

*Dasychone cingulata*, Willey, 1905, p 308, pl VII, figs 170—173  
Augener, 1914, p 122 (Synonymy) Fauvel, 1930b, p 1932, p 236

*Branchiomma cingulata*, Johansson, 1927, p 61

Branchial lobes equal, semi-circular, not spiral, Gill-filaments with paired dorsal, long and slender, stylodes and pairs of small eyes Lateral eye-spots between dorsal and ventral rami

*Length:* 10—30 mm by 2—3 mm

*Colour* Body with scattered dark spots.

*Occurrence* Burma coast, Mergui; Andaman Islands, Gulf of Mannar, Pamban.

*Distribution* Pacific Ocean, Indian Ocean, Arabian Sea, Persian Gulf, Red Sea

425. *Dasychone serratibranchis* Grube (Fig 234, i)

*Dasychone serratibranchis*, Grube, 1878, p 262, pl XIV, fig 7  
Ehlers, 1907, p 28 Augener, 1926a, p 257 Fauvel, 1932, p 236.

Branchial lobes equal, semi-circular, not spiral Dorsal stylodes short, appressed, appearing as small triangular serrations of the branchial filaments A few paired branchial eye-spots Body with lateral eye-spots

*Length:* 15—30 mm by 2—3 mm

*Colour* Gills with white, yellow and purple bands.

*Occurrence.* Mergui, Andaman Islands, Pamban

*Distribution* Philippine Islands, Indochina, New-Zealand, Australia, India

Fig 234—*Branchiomma pacificum* (Johansson) *a*, gill-tip, with eyes, *b*, thoracic hook  $\times 295$ , *c*, pick-axe seta  $\times 630$ , *d*, thoracic bristle  $\times 295$  (after Johansson) *Br intermedium* Beddard *e*, top of gill, with eye (after Beddard) *Dasychone cingulata* Grube *f*, portion of a gill's radiole, with eyes and stylodes, *g*, dorsal thoracic bristle, *h*, thoracic hook (after Willey) *D serratibranchis* Grube *i*, part of a gill's radiole with stylodes

### Genus BRANCHIOMMA Kolliker

#### *Megalomma* Johansson

Body elongated Branchial lobes symmetrical, semi-circular, not spiral Branchial filaments destitute of dorsal stylodes Subterminal compound eyes A two- or four-lobed collar Capillary setae winged In the thorax avicular uncini and pickaxe-shaped setae Tube coated with sand

*Key to the species of Branchiomma*

Collar low and very slanting A  
 double fold overlying the eyes  
 near the tip of the gills *intermedium*  
 Beddard, p 444

Collar high, hardly slanting, tip  
 of the gills without any fold *pacificum*  
 (Johansson), p 444

426 *Branchiomma pacificum* (Johansson) (Fig 234, a-c).

*Megalomma pacifica*, Johansson, 1927, p 130, fig 151

*Branchiomma pacificum*, Fauvel, 1932, p 237

(?) *Branchiomma quadrioculatum*, Willey, 1905, p 307, pl VII, figs 168-169

(?) *Branchiomma acrophthalmos* Grube, Willey, 1905, p 306, pl VII, figs 166-167

Eight thoracic segments with short, elongated, narrow-winged dorsal setae, aviculari uncini with a rather long base and pickaxe-shaped setae Abdominal capillary setae slightly broader than in the thorax, but not paleae-like (in adult specimens, paleae-like in the very young) Collar hardly slanting, dorsal lobes rather low, ventral lobes higher with two lateral and a median deep notches Subterminal eyes very large, encircling about half of the filament and appearing as double eyes

*Length.* 20-30 mm by 2 mm

*Occurrence* Moscos Islands, Burma, Ceylon (?)

*Distribution* Gilbert Islands, Pacific Ocean, Moscos Islands, India (?)

*Remarks* Very close to *B vesiculosum* (Montagu) from Europe and very likely conspecific

427. *Branchiomma intermedium* Beddard (Fig 234, e)

*Branchiomma intermedium*, Beddard, 1887, p 261, pl XXI, figs 4-7 Fauvel, 1932, p 237.

Eight thoracic setigerous segments with long and short, narrow-winged, dorsal setae, avicular uncini and pickaxe-shaped setae Abdominal capillary setae hardly broader, not enlarged into paleae-like structures Collar very low and slanting to the 3rd setigerous segment Branchial lobes borne on long stalks marked with a dark stripe. Gill filaments with a single subterminal eye Towards the extremity there is a double fold, just overlying the eye Tube of considerable thickness, coated with mud and broken shells

*Length.* 100 mm

*Colour* pale brown, gills darker

*Occurrence* Paway Island, Mergui Archipelago

*Distribution* Mergui Archipelago

### Genus SABELLASTARTE Krøyer

*Branchial lobes symmetrical* Branchial filaments destitute of dorsal stylodes Capillary setae winged, not paleae-like In the thorax, only ventral avicular uncini, *pickaxe-shaped setae absent* In the abdominal region, dorsal avicular uncini and ventral capillary setae

#### 428 *Sabellastarte indica* Savigny (Fig 235, a—h)

*Sabellastarte indica*, Augenei, 1914, p 115, pl I, fig 20 (Synonymy) Pruvot, 1930, p 85, pl II, figs 39—50 Fauvel, 1932, p 238 Monro, 1931, p 45

*Eurato notata*, Willey, 1905, p 310, pl VII, figs 174—175

*Eurato sancti-josephi*, Gravier, 1903, p 105, pl VII, figs 281—283

*Sabella pottaei*, Quatrefages, 1865, p 436

(?) *Sabella melanochlora*, Schmarda, 1861

Body large, stout, dark About 8 thoracic segments with dorsal capillary setae, all similar with a narrow wing, and ventral avicular uncini, pickaxe-shaped setae absent Abdominal ventral setae with a broader wing Collar well developed, with two dorsal lobes and a ventral lobe ending in two processes Gill-filaments numerous and densely crowded, eyeless, and without dorsal stylodes It differs from *Sabella* chiefly in the absence of pickaxe-shaped bristles in the ventral thoracic tori and by its *very numerous and thickly crowded gill-filaments*, which look as though set in two concentric rows in contracted specimens Tube membranous, coated with fine mud

*Length* 90—120 mm

*Colour* in spirit, dark-violet or grey with scattered dark spots

*Occurrence* Burma coast, Mergui, Akyab, Andaman Islands, Madras, Ceylon, Karachi

*Distribution* Japan, China Sea, Malayan Sea, New Caledonia, Australia, Indian Ocean, Red Sea, Tropical Atlantic Ocean

Genus **LAONOME** Malmgren

Branchial lobes symmetrical, semi-circular, not spiral  
Branchial filaments without dorsal stylodes No subterminal eyes A four-lobed collar. In the thorax dorsal capillary setae of *two kinds*, ventral uncini, *no pickaxe-shaped setae* In the abdomen, dorsal avicular uncini and ventral capillary setae

429 **Laonome indica** Southern. (Fig 235, d—h)

*Laonome indica*, Southern, 1921, p 652, pl. XXX, fig 20

Body slender 6 thoracic segments with dorsal long, slender capillaries with narrow wing and long tapering

Fig 235 —*Sabellastarte indica* Savigny a, anterior part, dorsal view, enlarged, b, collar, ventral view, c, thoracic hook  $\times 190$  (after Pruvot) *Laonome indica* Southern d, collar segment, ventral view  $\times 56$ , e, hook from the 2nd segment  $\times 800$ , f, hook from the 8th segment  $\times 800$ , g, spatulate thoracic bristles  $\times 560$ , h, capillary bristle from the 8th segment  $\times 600$  (after Southern)

tips and setae with spatulate tips terminating in a long fine point. Uncini with a stout rounded base and 4—5 rows of teeth above the main fang In the abdomen, dorsal uncini, differing very slightly from those of the thorax, with rounded base more oblique, and ventral capillary

setae with short and broad wings and a long and slender tip. The gills are unconnected by a membrane. There are two short palps and two ventral lobes projecting forwards and ending in a pointed tip. No eyes observed. Tube unknown.

*Length* 28 mm by 2 mm

*Occurrence* Chilka Lake

### Genus *HYPSICOMUS* Grube

Body long and slender, Branchial lobes symmetrical. Gill-filaments with rows of eyes. Dorsal stylodes absent. A collar. Capillary setae of the first thoracic segment set in a slanting row. Thoracic dorsal setae of two kinds (1) capillary, and (2) paleae-like. Ventral avicular uncini and pickaxe-shaped setae. In the abdomen, dorsal avicular uncini and ventral capillary setae and paleae.

#### 430. *Hypsicomus phaeotaenia* (Schmarda) (Fig 236, a—b)

*Hypsicomus phaeotaenia*, Gravier, 1908, p. 84, pl. VI, figs 255—259. Fauvel, 1927a, p. 312, fig. 108 (Synonymy), 1932, p. 238. Willey, 1905, p. 307.

*Hypsicomus pigmentatus*, Gravier, 1908, p. 81, pl. VI, figs 252—254.

*Hypsicomus marenzelleri*, Gravier, 1908, p. 78, pl. VI, figs 247—251.

*Sabella phaeotaenia*, Schmarda, 1861, p. 35, pl. XXII, fig. 188.

*Sabella fusco-taeniata*, Grube, 1874, p. 328.

Branchial lobes borne on a long stalk. Gill-filaments bearing on their rachis two longitudinal rows of simple eye-spots, single, or in more or less numerous groups. Collar low and straight, entire or notched. Short setae of the first setigerous segment set in a sigmoid, slanting row. Paleae spoon-shaped with a rounded winged end, with, or without, a sharp tip, and capillary setae. In the abdomen, dorsal avicular uncini and ventral capillary setae with broader paleae. Tube membranous, transparent.

*Length.* 40—60 mm

*Colour.* Very variable, body dark with pale feet and tori. Gills banded with yellow, brown, red or violet.

*Occurrence.* Mergui, Nankauri Harbour, Nicobar Islands, Great Coco Island, Ceylon, Gulf of Mannar, Pamban, Kilakarai, Maldivé Archipelago.

*Distribution.* Japan, China Sea, New Caledonia, Indo-China, Malay Archipelago, Australia, Indian Ocean, Persian Gulf, Red Sea, Atlantic Ocean

Fig 236—*Hypsicomus phaeotaenia* (Schmarda) a, (after Schmarda), b, anterior part, dorsal view, c, middle part of a gill-filament (after Gravier), d, e, bristles from the first segment, front and side view, f, thoracic winged seta  $\times 230$ , g, thoracic palea  $\times 230$ , h, abdominal palea  $\times 230$ ; i, pick-axe seta, k, thoracic hook  $\times 230$ , l, abdominal capillary bristle  $\times 400$

### Genus POTAMILLA Malmgren

Branchial lobes symmetrical Gill-filaments with or without eyes, without dorsal stylodes Setae of the first setigerous segment *in a tuft*. Dorsal thoracic setae of two kinds capillary and paleae, ventral uncini and pickaxe-shaped setae In the abdomen, dorsal avicular uncini and ventral winged setae. Tube horny

Fauvel, 1930a, p 62, 1932, p 239  
*Potamilla oligophthalmos*, Augener, 1914, p 109

A number of gill-filaments bearing one to 4-7 dorsal eyes set in a longitudinal row Collar well developed, with four lobes Straight, narrow winged, dorsal setae and paddle-shaped paleae with a slender tip Abdominal setae with unequal wings and a very long and slender tip

*Length* 10-40 mm

*Occurrence* Gulf of Mannar, Krusadai Island, Kuwait Harbour, Persian Gulf

*Distribution* Indochina, Malay Archipelago, Australia (?), India, Persian Gulf, Red Sea

- 432 *Potamilla leptochaeta* Southern (Fig 238, a-f)  
*Potamilla leptochaeta*, Southern, 1921, p 651, pl XXXI, fig 28  
Fauvel, 1932, p 239, 1939, p 26

Thoracic segments few, 6-7 8-11 gill-filaments destitute of eyes Collar sloping backwards, deeply notched and bilobed ventrally Thoracic and abdominal capillary setae with elongate narrow wings and *very long filiform tips* Thoracic spatulate setae have pear-shaped blades with finely pointed tips Pickaxe-shaped setae with *long slender tips* Tube membranous, coated with mud and sand

*Length* 10-40 mm

*Occurrence* Chingrighatta near Calcutta, Vizagapatam A blackish water species

*Distribution* Malay Archipelago, India

433. *Potamilla ceylonica* Augener (Fig 237, a-g)  
*Potamilla ceylonica*, Augener, 1926, p 470 Fauvel, 1930a, p 61, fig 17

Branchial fan with 7-10 gill-filaments ending in a long slender naked tip They are without eye-spots Collar very slanting, broadly gaping on the back and with two flattened, reflected, acute ventral flaps Palps broad

abdominal uncini aviculari, ventral setae winged, slender, often geniculate Tube membranous, transitory

434. *Jasmineira caducibranchiata* Willey (Fig 238, m-n)

*Jasmineira caducibranchiata*, Willey, 1905, p 312, pl VII, fig 178-179

Body tapering posteriorly. 8 thoracic segments with dorsal capillary setae and a single row of rostrate uncini with long manubrium Dorsal abdominal uncini avicu-

Fig 238—*Potamilla leptochaeta* Southern a, short capillary seta from an anterior abdominal segment  $\times 840$ , b, spatulate seta from the 6th thoracic segment  $\times 840$ , c, pick-axe seta  $\times 840$ , d, abdominal hook  $\times 840$ , e, thoracic hook  $\times 840$ , f, tip of a gill (after Southern) *P. ehlersi* Gravier. g, thoracic hook; h, pick-axe seta, i, thoracic palea (after Gravier) *Manayunkia spongicola* Southern k, thoracic hook  $\times 700$ , l, abdominal hook  $\times 870$  (after Southern) *Jasmineira caducibranchiata* Willey m, abdominal hook, n, thoracic hook (after Willey).

lar Collar rounded, slightly projecting forwards below, with a median notch dividing the two low rounded lobes and a shallow impression on each side of the notch. About a dozen radioles on each branchial filament. In-

side the gill-crown a pair of broad, pinkish laciniae, and below these a group of about 6 slender tentacular cirri attached to the lower ends of the gill-carriers

*Length* 22 mm by 15 mm

*Occurrence* East side of Cheval Paar, Ceylon

### Genus MANAYUNKIA Leidy.

#### *Haplobranchus* Bourne

Body very small Branchial lobes symmetrical, branchial filaments simple, unbranched Two palps. A collar Ventral scutes absent Dorsal thoracic setae Uncini with a long stalk, pickaxe-shaped setae absent Abdominal uncini elongated, ventral capillary setae

#### 435. *Manayunkia spongicola* Southern (Fig 238, k, l)

*Manayunkia spongicola*, Southern, 1921, p 653, pl XXXI, fig 29

Body cylindrical 8 thoracic segments with dorsal capillary setae with short, flattened, blades and long slender tips Ventral hooks stout, with three teeth above the main fang In the three abdominal segments 1-2 capillary setae with very slight flattening of the blade and no wings, 9-11 dorsal hooks, rather small, with elongate shafts and numerous fine long teeth in several rows at one end The gills consists of about 18-20 slender unbranched filaments on each side Two clavate palps Head conical in front, bearing two black eyes A prominent collar, with an entire convex border ventrally No otocysts Pygidium spatulate, or pear-shaped, bearing two black eyes Tube membranous, covered with flocculent mud

*Length* 15 to 3 mm

*Occurrence* Chilka Lake, brackish water Tubes embedded in the sponge *Laxosuberites lacustris* Annandale, or amongst Algae.

*Remarks* The presence of eyes on the pygidium and a more developed collar are the principal features differentiating this species from *M aestuarina* Bourne

### Family SERPULIDAE Burmeister.

Body divided into two regions (1) thoracic, consisting of a few segments bearing dorsal and capillary setae and ventral uncinigerous tori, (2) abdominal, which is much longer, and has dorsal uncinigerous tori and ven-

tral capillary setae Ventral glandular shields divided by a longitudinal shallow groove First segment with a more or less developed collar *A thoracic membrane*. Gills forming a funnel surrounding the mouth and composed of two semi-circular or spiral lobes bearing a number of filaments or radioles with two rows of barbules. *Usually an operculum* Tubes calcareous

*Key to the genera of SERPULIDAE*

### Genus SERPULA Linnaeus.

Collar setae bayonet-shaped, with two conical processes at the base of the blade. Operculum funnel-shaped, with numerous radii ending in serrations along the margin. Uncini with only few stout teeth. Thoracic setae winged, abdominal setae trumpet-shaped

#### 436. *Serpula vermicularis* Linnaeus. (Fig. 239, a—q).

*Serpula vermicularis*, Pixell, 1913, p 71. Fauvel, 1927a, p. 351, fig 120 (Synonymy), 1932, p 241

Collar setae with two large, conical, blunt processes at the base. Uncini with 4—7 teeth, the lower one more stout and blunt. Collar trilobed. Operculum concave, with numerous radii, symmetrical. Tube variable, cylin-

## SERPULA

drical, wrinkled, with 5-7 longitudinal ridges, smooth or serrated or echinulate, rather bell-shaped at the mouth, more or less crooked and generally of a red or pink colour, more rarely white

Fig 239—*Serpula vermicularis* Linn a, side view  $\times 25$ , b, tube, natural size, c, d, section of the tube, e, f, operculum, g, false operculum, h, thoracic bristle  $\times 105$ , i, bristle from the first setigerous segment (collar bristle)  $\times 105$ , k, young collar bristle with denticles at the base of the prongs  $\times 105$ , l, capillary seta from the collar  $\times 105$ ; m, abdominal uncus  $\times 350$ , n, o, thoracic uncini  $\times 350$ , p, abdominal uncus  $\times 350$ , q, another form of uncus  $\times 350$

Length. 50-70 mm by 5-6 mm

Colour in life very variable. Operculum with radiating red and white streaks

Occurrence Moscos Islands, Burma, Orissa Coast, Madras Coast, Persian Gulf

Distribution Magellan, Indian Ocean, Kerguelen, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea

var. *granulosa* Marenzeller.

*Serpula granulosa*, Marenzeller, 1884, p 215 Willey, 1905, p 316, pl VII, figs 186, 186A

"Operculum shallowly concave, with 46-52 rays which project as denticulations at the margin. The

grooves which separate the rays do not all reach to the centre of the disc, they are superficial indications of dissepiments which project vertically with a free inner border into the substance of the operculum. Minute tubercles are sparsely distributed on the concave opercular disc. Tube round, subcristate to cristate" (Willey)

*Occurrence* South-west Cheval Paar, Ceylon

*Distribution* Japan, Ceylon.

var. *watsoni* Willey.

*Serpula watsoni*, Willey, 1905, p 317, pl. VII, fig 187, pl VIII, fig 6

Characterised by the great length of the ampulla of the operculum, which is about twice the length of that portion of the style which rises above the collar. The collar is entire below, divided on each side by a lateral notch.

*Occurrence.* Trincomalee.

## Genus HYDROIDES Gunnerus

### *Eupomatus* Philippi

Collar setae bayonet-shaped, with two conical processes at the base of the blade. Uncini with a few coarse teeth, the lower one larger than the others. Thoracic setae winged, abdominal setae trumpet-shaped. *Operculum funnel-shaped with a crown of horny spines arising from the centre.*

### *Key to the species of Hydroides*

crown with 5—6 oval, concave valves, with a raised smooth border. One, slightly larger, ends in a long recurved hook turned inwards. The valves are connected at half-length by a membrane forming pockets. Tube whitish, encrusting, rough, more or less spiral or sinuous.

*Length* 5—6 mm by 0.5 mm.

*Occurrence.* Persian Gulf. Dredged on *Avicula's* shells.

438. *Hydroides homoceros* Pixell. (Fig. 241, a).

*Hydroides homoceros*, Pixell, 1913, p. 74, pl. VIII, fig. 1

"The opercular funnel has about 17 teeth with lateral processes, and the central crown consists of 7 slender spines, each having a pair of lateral hooks about half-way and a median basal internal one. Tube slightly ribbed, not much bent, mouth simple" (Pixell)

*Length.* 13—24 mm by 2 mm

*Occurrence.* Maldivé Archipelago

439. *Hydroides norvegica* (Gunnerus). (Fig. 241, i).

*Hydroides norvegica*, Pixell, 1913, p. 74. Fauvel, 1927a, p. 356, fig. 122, i—o, 1932, p. 242.

*Eupomatus elegans*, Haswell, 1883b, p. 633, pl. XII, fig. 1

Radii of the operculum forming rounded lobes on the edge of the funnel, spines of the central crown equal, with several sharp lateral processes. Tubes white, cylindrical, faintly wrinkled and more or less erect or spirally coiled.

*Length.* 15—30 mm by 1—2 mm.

*Occurrence.* Madras

*Distribution.* Indian Ocean, Persian Gulf, Red Sea, Atlantic Ocean, Mediterranean Sea.

440. *Hydroides lunulifera* (Claparède). (Fig. 241, h)

*Hydroides lunulifera*, Fauvel, 1927a, p. 358, fig. 122, p—s, 1932, p. 242. Potts, 1928, p. 701

*Eupomatus lunulifera*, Claparède, 1868, p. 441, pl. XXXI, fig. 3

Radii of the operculum forming sharp lobes on the edge of the funnel, spines of the central crown equal with flattened half-moon or anchor-shaped tips. Tubes slender, white, cylindrical, more or less coiled.

*Length* 12–30 mm by 1–3 mm

*Occurrence.* Madras

*Distribution:* Madras, Suez Canal, Mediterranean Sea

441 *Hydroides heteroceros* (Grube) (Fig 241, c)

*Hydroides heteroceros*, Fauvel, 1911, p 428 Pixell, 1913, p 75, pl VIII, fig 2

*Hydroides uncinata* (non Philippi), Gravier, 1908, p 114, pl VIII, 286–287

*Eupomatus heteroceros*, Grube, 1868, p 639, pl VII, fig 8 Willey, 1905, p 313

Radu of the operculum with a terminal knob Seven spines in the central crown, bent at the tip and with

Fig 241—*Hydroides* operculum a, *H. homoceros* (Pixell)  $\times 24$ , b, *H. exaltatus* (Marenzeller)  $\times 11$ ; c, *H. heteroceros* (Grube)  $\times 12$  (after Pixell), d, e, *H. albiceps* (Ehrenberg), dorsal and side view (after Willey), f, *H. minax* (Grube)  $\times 18$  (after Grube) g, *H. monoceros* Gravier (after Gravier), h, *H. lunulifera* (Claparède)  $\times 21$ , i, *H. norvegica* (Gunnerus)  $\times 21$

lateral hooks, the seventh is much larger, bent, alpenstock-shaped and destitute of lateral processes Tubes thick, flattened on side of attachment, often coiled, marked by faint longitudinal lines, aperture circular

*Length* about 40 mm by 4 mm

*Colour* Body dull yellowish, gills dark crimson at the base, light yellow distally

*Occurrence* Ceylon, Koweit Harbour.

*Distribution* India, Persian Gulf, Red Sea, Zanzibar,

442. *Hydroides monoceros* Gravier (Fig 241, g)

*Hydroides monoceros*, Gravier, 1908, p 115, pl VIII, fig 288  
 Pixell, 1913, p 76 Fauvel, 1923, p 48, 1930a, p 63

The lower funnel of the operculum is *oval* and slanting, has teeth with enlarged extremities. The asymmetrical central crown has 6 very small spines and bears a very large one with a lateral triangular hook on each side and a strong curved terminal tip. Tubes thick, more or less curved, with longitudinal and transverse ridges.

*Length* about 15 mm

*Occurrence*: Rameswaran, Gulf of Mannar

*Distribution*. Gambier Islands, India, Red Sea, Zanzibar

*Remarks*: Closely allied to *H minax* (Grube)

443 *Hydroides minax* (Grube) (Fig 241, f)

*Hydroides minax*, Fauvel, 1939, p 361  
*Serpula minax*, Grube, 1878, p 269, pl XX, fig 5  
*Eupomatus minax*, Willey, 1905, p 314

Radius of the inferior part of the operculum numerous, with a small terminal knob. Central crown *symmetrical*, with 6 short pointed spines bent outwards, the 7th, much larger, is erect, with a stout recurved hook, bent inwards and with two lateral accessory hooks. Tube round, showing coarse growth rings.

*Occurrence* Ceylon

*Distribution* Philippine Islands, Annam, Ceylon

444 *Hydroides albiceps* (Ehrenberg) (Fig 241, d, e)

*Eupomatus albiceps*, Grube, 1969, p 520 Willey, 1905, p 312,  
 pl VII, figs 180-181

Marginal teeth of the opercular funnel blunt. Central crown with 7-8 nearly erect, slightly curved virgulae and a laterally compressed, ovate, lamina dorsalis, the latter being a direct continuation of the columella and bearing a pair of broad dorso-lateral hamuli. Thoracic uncini with about 7-9 teeth. Tube quadrilateral, winding round a tube of *Chaetopterus ramosus*.

*Length* 7 mm

*Occurrence* Ceylon, Cheval Paa

445 *Hydroides exaltatus* (Marenzeller) (Fig 241, b).

*Eupomatus exaltatus*, Marenzeller, 1884, p 217, pl IV, fig 3  
 Willey, 1905, p 312, pl VII, fig 182, Pixell, 1913, p 77

"The inner funnel of the operculum is raised on a short column and has 8-9 strong hook-like spines, without secondary processes, except at the base, the dorsal one is twice as large as the others and bends suddenly at a right angle over the top of them" (Pixell).

*Length* about 20 mm

*Colour* Body dull green

*Occurrence* Ceylon

*Distribution* Japan, India, Red Sea, Zanzibar

var *vesiculosus* Fauvel (Fig 240, i)

*Hydroides exaltatus*, var *vesiculosus*, Fauvel, 1919, p 342, fig 1,  
 1923, p 40, 1939, p 30 Monro, 1937, p 316

A large hollow vesicle takes the place of the great unpaired hook. It is a connecting link between *H. exaltatus* (Marenzeller) and *H. albiceps* (Ehrenberg)

*Occurrence* Gambier Islands, Java, Zanzibar

## Genus POMATOLEIOS Pixell.

"Collar setae and eye-spots absent. Uncini with fairly numerous teeth, the most anterior being larger and gouged underneath. Abdominal setae trumpet-shaped with one side produced into a long spine. Operculum flat with winged pedicle. Tube with a flap over the entrance" (Pixell)

446 *Pomatoleios crosslandi* Pixell

*Pomatoleios crosslandi*, Pixell, 1913, p 85, pl IX, fig 10

"All thoracic setae simple striated blades. Uncini with 10 or 11 teeth in both thorax and abdomen. Branchiae with very high inter-branchial membrane and long bare terminal filaments" (Pixell)

*Remarks* The operculum of the Madras specimen is tipped with a hollow calcareous cup destitute of spines. The pedicle has thick lateral wings with straight edges.

Neither Pixell nor I were able to detect any collar setae. The flap of the tube, mentioned by Crossland, has not been observed again.

*Length* 4–14 mm

*Occurrence* Madras

*Distribution* Madras, Red Sea

*Remarks.* Differs only from *Pomatoceros caeruleus* in the absence of collar setae, flat operculum and flap of the tube

### Genus *SPIROBRANCHUS* Blainville.

“Operculum with a calcareous plate generally bearing a group of branched spines. Pedicle with broad lateral wings. Collar setae bayonet-shaped and covered with fine hair-like processes. Abdominal setae trumpet-shaped, the edges compressed and toothed and produced at one place into a long fine point. Uncini with numerous teeth, the lower one larger and hollowed out underneath like a gouge. Uncinigerous tori of the two sides widely separated ventrally in front, and gradually approaching one another towards the end of the thorax, thus leaving a triangular depression” (Pixell)

#### *Key to the species of Spirobranchus.*

- 1 Operculum without processes *maldivensis* Pixell, p 464
  - Operculum with processes . 2
  - 2 Opercular plate with two antler-like processes. Pedicle winged *giganteus* (Pallas), p 462

*Pomatoceroopsis coutierei*, Gravier, 1908, p 125, pl VIII, figs 294, 299

Opercular plate with two antler-like processes, which sometimes, however, branch close to their base. Abdomen about 11 times as long as its greatest breadth with numerous (200–300) segments (Pixell)

There is a considerable range of variation to be found in the operculum whose antlers may be more or less developed and branched, but too often they are broken. The tube is pink, but generally more or less imbedded in the corals.

Fig 242—*Spirobranchus giganteus* (Pallas) a, bristles from the first setigerous segment  $\times 240$ , b, ventral abdominal trumpet-shaped bristle  $\times 240$ , c, thoracic hook  $\times 240$ , d, lower tooth of a thoracic hook  $\times 395$ , e, f, g, several kinds of operculum (after Grube and Quatrefages) *Spir jousseaumei* (Gravier), h, operculum (after Gravier), *Spir maldivensis* Pixell i, operculum (after Pixell) *Vermiliopsis glandigerus* Gravier k, operculum (after Gravier)

**Length** 100–120 mm by 6–7 mm

**Colour** Body yellow, with a deep blue thoracic membrane. The gills are blue at the base and with white, blue and pink stripes.

**Occurrence** Nankauri Harbour, Nicobar Islands, Great Coco Island, Ceylon.

**Distribution** Intertropical areas of Pacific, Indian and Atlantic Oceans, especially in coral reefs.

448 *Spirobranchus jousseaumei* (Gravier) (Fig 242, h)*Spirobranchus jousseaumei*, Potts, 1928, p 701 Fauvel, 1932, p 244*Pomatoceroopsis jousseaumei*, Gravier, 1908, p 130, pl VIII, figs 292—293

Opercular plate with several distinct, much branched processes Pedicle winged Tube with several wavy ridges

*Length.* 30 mm*Colour* Gills of a deep violet-blue colour*Occurrence* Palan Biddang*Distribution* Palan Biddang, Red Sea, Suez Canal449 *Spirobranchus maldivensis* Pixell (Fig 242, i)*Spirobranchus maldivensis*, Pixell, 1913, p 84, pl IX, fig 9 Fauvel, 1932, p 245 Monro, 1937, p 318

“Operculum a thick calcareous plate, without processes, supported by a tall pedicle with thin lateral wings Collar setae with a short, wide, finely striated, fin-like process at the base of the narrow anterior blade Branchiae about 32 pairs with numerous long pinnae except at their distal ends, which are bare and filamentous Thoracic uncini have about 15 teeth in addition to the large gouge-shaped one, and the abdominal 13 Abdominal setae narrow compressed trumpets, with one side produced into a long process” (Pixell) Tube with one or three coarsely serrated ridges

*Length:* 20—30 mm.*Occurrence* Off Cape Negrais, Burma, 40 fms Gulf of Oman*Distribution* Burma, Maldivé Archipelago, Arabian Coast, Gulf of Oman

## Genus POMATOSTEGUS Schmarda

Collar setae bayonet-shaped and covered with hair-like processes Operculum with a slanting calcareous plate or several horny discs united by a central vertical column Opercular pedicle with lateral wings Abdominal setae trumpet-shaped or *Salmacina*-like

*Key to the species of Pomatostegus.*

Operculum with a slanting plate

Abdominal setae trumpet-shaped

*polytrema* Philippi, p 465

Operculum with horny discs

Abdominal setae *Salmacina*-like *stellatus* Abildgaard, p 465

*Pomatostegus actinoceros*, Willey, 1905, p 314, pl VIII, figs 34  
Augener, 1914, p 152

Operculum with several horny denticulated discs piled up very close and strung on a hollow pillar with rows of star-like diverging spines and a circle of spines under each plate Pedicle flat, with broad smooth wings A high collar Abdominal setae sickle-shaped (*Salmacina* setae).

*Occurrence* Malacca Straits, Andaman Islands, Gulf of Mannar, Krusadai, Pamban, Ceylon, West Coast of India

*Distribution* Pacific, Indian and Atlantic Oceans.

451. *Pomatostegus polytrema* Philippi (Fig 245, l-q)

*Pomatostegus polytrema*, Rioja, 1917, p 87, fig 25 Fauvel, 1927a

Operculum a membranous vesicle shaped as an inverted cone capped with a calcareous plate which may be level, convex or bluntly conical, smooth, or bearing 1, 2 or 3, more or less developed prongs very variable in shape Abdominal setae trumpet-shaped Tube with characteristic alveoles and perforations

*Distribution* Atlantic Ocean, Mediterranean Sea.

var. *indica* Fauvel. (Fig 206, h, i)

*Pomatostegus polytrema* var. *indica*, Fauvel, 1930a, p 64, fig 15, h-i

Lower bladder of the operculum capped with a rigid cone, somewhat arched and bearing a number of small spines on its concave side.

*Occurrence*: Gulf of Mannar, Krusadai Island

## Genus VERMILIOPSIS Saint-Joseph

*Vermilia* pro parte.

"Collar setae simple blades Uncini with fairly numerous teeth, the most anterior are larger and blunter than the rest Abdominal setae geniculate Some thoracic setae are bladed sickles (setae of *Apomatus*), thus differing from the genus *Vermilia* with ordinary bladed setae only Operculum with a horny somewhat cylindrical or conical cap" (Pixell)

*Key to the species of Vermiliopsis*

- |                                |                                       |

452. *Vermiliopsis pygidialis* (Willey). (Fig 243, a—b).

*Vermiliopsis pygidialis*, Pixell, 1913, p 86, pl 9, fig 11

*Vermilia pygidialis*, Willey, 1905, p 318, pl VII, figs 194—196

Branchiae with ocelli and elongated, often with much swollen ends free from pinnae Operculum with a conical (sometimes truncated) chitinous cap Uncini with

Fig 243—*Vermiliopsis pygidialis* (Willey) a, anterior region, dorsal view, enlarged, b, thoracic hook (after Willey) *V. acanthophora* Augener c, anterior part, dorsal view  $\times 14$ , d, operculum  $\times 23$ , e, tube, aperture somewhat damaged  $\times 2$  (after Augener)

13—14 teeth Terminal dorsal gland generally present as an oval purplish-crimson cushion, with long hair-like setae on the obtuse last segments Tube coiled, with 4—5 low longitudinal keels

*Length:* about 20 mm.

*Colour* Gills tipped with pink  
*Occurrence* Ceylon  
*Distribution* India, Maldive Archipelago, Suez, Zanzibar

453 *Vermiliopsis acanthophora* Augener. (Fig 243, c—e)

*Vermiliopsis acanthophora*, Augener, 1914, p 155, pl I, figs 21—24, Fauvel, 1930a, p 63, Monro, 1937, p 318

The flat, smooth, wingless pedicle of the operculum bears a white hemisphere capped with a yellow cone, *without chitinous partitions*, ending in a horn-like hook. The thoracic segments bear *Apomatus* setae. Tube with traces of successive peristomes.

*Length* 20 mm

*Occurrence* Gulf of Mannar, Krusadai Island

*Distribution* Galapagos Islands, Australia, Gambier Island, India, Gulf of Oman, Arabian Coast

454. *Vermiliopsis glandigerus* Gravier. (Fig 242, k).

*Vermiliopsis glandigerus*, Gravier, 1908, p 121, pl VIII, figs 290—291

*Vermiliopsis glandigera*, Augener, 1918, p 602 Fauvel, 1930a, p 63 Monro, 1937, p 318

The wrinkled pedicle of the operculum bears a white opaque hemisphere, with a yellow horny cone, short or elongate, divided by 3—4 partitions and sometimes slightly hollowed at the tip in a small cup. Thoracic segments with *Apomatus* setae. Tube wrinkled, with 4—5 longitudinal keels and more or less conspicuous transverse peristomial ridges.

*Length* 15—20 mm

*Occurrence* Gulf of Mannar, Krusadai and Shingle Islands, Rameswaram

*Distribution* Panama, India, Arabian Sea, Red Sea, Madagascar, Atlantic Ocean, West Africa, Gulf of Guinea

Genus OMPHALOPOMOPSIS Saint-Joseph

Operculum chitinous or horny, concave or funnel-shaped. Thoracic membrane very short. Setae of the first segment (collar setae) acicular, or geniculate. Thoracic setae winged capillaries and *Apomatus* setae. Abdominal setae geniculate and long slender capillaries. Uncini pectiniform, with lower tooth larger but not gouge-like.

455. *Omphalopomopsis langerhansi* (Marenzeller). (Fig 244, a-h)

*Omphalopomopsis langerhansi*, Fauvel, 1930a, p 65, fig 18

*Omphalopoma langerhansi*, Marenzeller, 1884, p 219, pl IV, fig 6

Operculum with a yellow rounded plate slightly depressed, saucer-like, with a single stout spike arising nearly in the centre. It is borne on a huge thick pedicle, nearly as broad as the terminal plate, bulging in the middle and with edges thinned into lateral smooth wings, without any processes. Gills short, thick, crowded into dense semi-circular clusters, in-rolled, but not spirally

Fig 244—*Omphalopomopsis langerhansi* (Marenzeller) a, anterior part and operculum, dorsal view  $\times 4$ , b, anterior region, ventral view  $\times 4$ , c, abdominal uncus  $\times 400$ , d, thoracic uncus  $\times 400$ , e, apomatus seta from the last thoracic segment  $\times 150$ , f, thoracic winged capillary bristle  $\times 150$ , g, abdominal geniculate bristle  $\times 400$ , h, collar seta from the 1st segment  $\times 300$

coiled. The collar, widely open dorsally, has an irregular serrated edge but no distinct flaps. Thoracic membrane very short. 7 thoracic segments. Collar setae minutely spinose. Other thoracic setae winged and accompanied by *Apomatus* setae in the last thoracic segments. Thoracic tori very long, nearly meeting in the middle.

of the ventral side Abdominal setae somewhat geniculate and serrated Abdominal tori very long, with pectiniform uncini whose lower tooth is larger, but not gouge-like

*Length.* 35 mm by 5 mm.

*Colour* pedicle of the operculum variegated with dark spots Gills tinged with violet-brown

*Occurrence* Gulf of Mannar, Rameswaram

*Distribution* Japan, India

### Genus POMATOCEROS Philippi

Operculum with a calcareous plate very variable, flat or conical, smooth or spinose, borne on a *winged pedicle*.

Fig 245 — *Pomatoceros triqueter* Linn *a*, anterior part, ventral view, enlarged, *b*, *c*, several shapes of operculum, *d*, tube, natural size and section, *e*, collar bristle  $\times 235$ , *f*, thoracic bristle  $\times 235$ , *g*, abdominal bristle  $\times 235$ , *h*, trumpet-shaped abdominal bristle  $\times 315$ , *i*, *k*, uncini, front and side view (*P. coeruleus* Schmarda is very likely but a mere colour variety of *P. triqueter* Linn) *Pomatostegus polytrema* Philippi *l*, operculum, enlarged, *m*, *n*, tube with section  $\times 2$ , *o*, collar bristle  $\times 315$ , *p*, *q*, thoracic bristles  $\times 315$ , *r*, *Apomatus* seta from the last thoracic segment  $\times 315$ , *s*, abdominal trumpet-shaped bristle  $\times 315$ , *t*, *u*, uncini, front and side view  $\times 315$

A high collar. Collar setae very fine, short and few. Other thoracic setae winged capillaries Abdominal setae compressed, trumpet-shaped with a long lateral point.

Uncini pectiniform with lower tooth larger and gouge-like. Tube triangular in section, incrusting the support.

456. *Pomatoceros caeruleus* (Schmarda). (Fig. 245, a—k)

*Pomatoceros caeruleus* Ehlers, 1907, p. 30. Fauvel, 1930a, p. 67.

*Pomatoceros strigiceps*, Ehlers, 1904, p. 67, pl. IX, figs. 11—19.

Gills, collar and thorax bright indigo-blue. Otherwise hardly distinct from *P. triqueter* Linnaeus. Operculum probably variable, tube less regularly triangular, often coloured blue inside.

*Length* 15—25 mm.

*Occurrence* Ennur Backwater, Madras Harbour.

*Distribution* New Zealand, Australia, Indian Ocean.

Genus *DITRUPA* Berkeley.

Operculum an inverted cone with a horny plate. Pedicle smooth, wingless. A collar. *Collar setae absent*. Thoracic setae capillaries and winged setae. Abdominal setae capillary. Uncini pectiniform, with numerous teeth, the lower one gouged. Tube calcareous, *free*, open at both ends, *Dentalium*-like.

457. *Ditrupa arietina* O. F. Muller. (Fig. 246, a—g)

*Ditrupa arietina*, Saint-Joseph, 1898, p. 443, pl. XXIII, figs. 249—254. Fauvel, 1927a, p. 374, fig. 128, a—g, 1932, p. 247.

Operculum vesicular, opercular plate horny, thick, brown, flat or convex, often encrusted. Tube smooth, elephant tusk-shaped, curved and tapering, narrowed at the mouth, white or with brown rings, made of two calcareous layers, the inner opaque white, the outer translucent.

*Length.* 10—20 mm by 1—2 mm. Tube, 25—40 mm. by 2—3 mm.

*Occurrence.* Andaman Sea, 785 fms.

*Distribution* Philippine Islands, Andaman Sea, Red Sea, Atlantic Ocean, Mediterranean Sea.

var. *monilifera* Fauvel. (Fig. 246, h).

*Ditrupa arietina* var. *monilifera*, Fauvel, 1932, p. 247, pl. IX, fig. 12.

The tubes show a number of more or less regular annular enlargements, giving them a moniliform appearance.

Fig 246 —*Ditrupa arietina* O F Muller a, ventral view  $\times 4$ , b, operculum  $\times 6$ , c, tube, natural size, d, thoracic bristle  $\times 220$ , e, abdominal bristle  $\times 100$ , f, g, hooks, front and side view  $\times 400$ , h, var *monilifera* tube  $\times 2$

*Occurrence.* Andaman Sea, 378 fms

*Distribution* Kei Islands, Andaman Sea.

### Genus *PROTULA* Risso

Operculum absent Collar setae simple tapered blades, thoracic setae winged capillaries and *Apomatus* setae, abdominal setae either sickle-shaped or bayonet shaped Uncini bicuspid, with very numerous, very fine teeth and a long basal spine. Tube white, cylindrical, nearly smooth, often partly erect.

458. *Protula tubularia* (Montagu) (Fig 247, a-i).*Protula tubularia*, Fauvel, 1927a, p 382, fig 130*Protulopsis palliata*, Willey, 1905, p 316, pl VIII, figs 183-185

Abdominal setae sickle-shaped Collar trilobed A very large thoracic membrane Gills woolly. Branchial filaments with red eye-spots at the back. Tube white, nearly smooth, coiled at the base, then erect

Fig 247—*Protula tubularia* (Montagu) a, with its tube (after Quatrefages), b, anterior region, ventral view (after Rioja), c, branchial funnel, from above, gills cut off, d, anterior part, side view  $\times 35$ , e, thoracic winged bristle  $\times 132$ , f, *Apomatus* seta  $\times 132$ , g, abdominal bristle, h, i, abdominal bristle before and after treatment with weak potash solution, curve inverted  $\times 220$ , k, l, uncini  $\times 350$  *Pr intestine* (Lamarck) m, anterior part, ventral view (after Rioja)

**Length** 20–50 mm. by 3–8 mm

**Colour:** Body red or orange, gills with white and red or orange streaks

**Occurrence:** Ceylon.

**Distribution** Japan, Australia, Malay Archipelago, Indian Ocean, Persian Gulf, Atlantic Ocean, Mediterranean Sea.

## Genus FICOPOMATUS Southern

"Modified setae present on the first thoracic segment, having blades provided with very stout teeth Beneath the blades is a transverse row of more than two teeth Uncini with relatively few teeth, the lowest of which is in the form of an elongate bifid spine Ventral abdominal setae geniculate Operculum fig-shaped, without any outgrowths" (Southern)

459 *Ficopomatus macrodon* Southern. (Fig 248, c-l)

*Ficopomatus macrodon*, Southern, 1921, p 655, pl XXX, fig 27, a-m, Fauvel, 1932, p 248

Operculum soft, vesicular, fig-shaped, flat or convex at the tip, without any outgrowths, stem rather flattened Branchial filaments 13-17 in number, bearing 18-20 pairs of barbules 7 thoracic setigerous segments Collar

Fig 248 — *Pomatostegus stellatus* Abildgaard a, anterior end with operculum, dorsal view (after Willey) *Spirorbis foraminosus* Moore b, operculum filled with eggs, front view (after Moore) *Ficopomatus macrodon* Southern, c, front view of the aperture of an attacher tube, d, operculum, side view  $\times 32$ , e, modified seta from the first setigerous segment  $\times 400$ , f, thoracic capillary bristle  $\times 400$ , g, simple capillary seta from the first segment  $\times 400$ , h, i, thoracic hook, front and side view  $\times 640$ , k, abdominal hook  $\times 640$ , l, ventral abdominal bristle  $\times 440$  (after Southern)

high Free margin of the thoracic membrane entire Collar setae of two kinds (1) stout setae with a series of very coarse teeth diminishing in size towards the smooth tip, beneath these teeth for some distance the shaft is smooth and this is followed by a transverse row of teeth, and (2) slender setae with finely tapering tips and minutely hispid edges Thoracic setae capillary, flattened Abdominal setae geniculate Tube free or erect, circular in section, with a single dorsal ridge, or squarish with three dorsal ridges.

*Length* 8–10 mm by 0.5–0.75 mm

*Colour* Traces of blue pigment bands on the gills and thorax

*Occurrence.* Taléh-Sap, Gulf of Siam, Sunderbans, Ennur Backwater, Madras Coast, Cochin Backwater, Chepparam

### Genus *MERCIERELLA* Fauvel

Operculum non-calcareous, vesicular, crowned with concentric rows of simple *horny spines* Opercular pedicle smooth, wingless Branchial filaments without eyes Interbranchial membrane absent Collar entire. A thoracic membrane A pair of palps Lowest tooth of the uncini stout and *gouged* Collar setae with *two rows* of sharp teeth Dorsal thoracic setae winged Abdominal setae geniculate Tube circular in section

#### 460. *Mercierella enigmatica* Fauvel (Fig 249, a–o)

*Mercierella enigmatica*, Fauvel, 1923d, p 124, fig 1, 1927a, p 360, fig 123, 1932, p 249 Monro, 1924, 155, fig a–e Rioja, 1924, p 160, figs 1–30, pl V, figs 1–3

Seven thoracic segments Branchial filaments stout, short, with a naked tip variable in length Interbranchial membrane absent Operculum somewhat fig-shaped, bearing concentric rows of simple, horny, sharp, blackish spines Pedicle stout, thick, smooth, subtriangular in section, wingless, with a shallow dorsal groove Two finger-shaped palps Collar tall, erect, or turned down, without lateral notches, edges entire, it is continuous with the thoracic membrane which is very broad and terminates in a back flap Collar setae of two kinds (1) slender filiform capillaries, and (2) strongly serrated setae with two longitudinal rows of teeth, a few transverse rows at the base and without an intervening smooth part of the shaft Other dorsal thoracic setae straight, or faintly bent, smooth or very finely hispid Uncini with a single

row of 5—7 teeth, the lowest of which is larger and *goug-ed*. Abdominal uncini more triangular, with more numerous teeth. Abdominal setae long, geniculate, serrated. Pygidium conical, with two rounded knobs. Tube calcareous, whitish, thin, cylindrical, wrinkled and bell-shaped at the entrance, the successive peristomes forming collars all along. It is coiled at the base, then erect.

Fig. 249—*Mercierella enigmatica* Fauvel. *a*, tube  $\times 26$ , *b*, side view  $\times 9$ , *c*, *d*, operculum, front and side view  $\times 13$ , *e*, opercular spines  $\times 52$ , *f*, section of the opercular stalk, *g*, *h*, modified bristle of the first setigerous segment, side and front view  $\times 516$ , *i*, capillary bristle from the first setigerous segment  $\times 344$ , *j*, thoracic bristle  $\times 344$ , *m*, *n*, thoracic uncini, front and side view  $\times 516$ , *o*, abdominal uncini  $\times 516$ .

Usually lives in brackish but sometimes in nearly fresh water, very rarely in pure seawater.

*Length* 6—25 mm by 1—2 mm

*Colour.* Operculum chestnut, with a white or yellow ring. Gills greenish with brown spots. In spirit, abdomen uncoloured, thoracic tori chestnut, gills ringed with chestnut and chalky white.

*Occurrence* Ennur Backwater, on oyster shells

*Distribution* Malay Archipelago, Australia, India, Atlantic Ocean (France, Morocco, Uruguay), Mediter-

anean Sea, Adriatic Sea, English Channel In canals, estuaries and on ships' bottoms

Genus **SALMACINA** Claparède.

Operculum absent Branchiae few, more or less enlarged at the tip Prostomium rounded, with two eyes A collar Collar setae notched, with a broad fin-like expansion at the base of the blade Other thoracic setae

Fig 250—*Filograma implexa* Berkeley *a*, operculum, *b*, collar bristle  $\times 500$  *Salmacina dysteri* (Huxley) *c*, ventral view, enlarged, *d*, tip of a gill-radiolar  $\times 40$ , *e*, collar bristle  $\times 500$ , *f*, thoracic bristle  $\times 500$ , *g*, abdominal bristle  $\times 500$ , *h*, posterior abdominal bristle  $\times 500$ , *i*, hook  $\times 500$ , *k*, clustered tubes, natural size

capillary, limbate, and sickle-shaped setae Abdominal setae geniculate and serrated Uncini pectiniform, with the lower tooth larger Calcareous tubes, very small and slender, crowded in aggregate fenestrated masses. Hermaphrodite Schiziparous

461. *Salmacina dysteri* Huxley (Fig 250, c-k)

*Salmacina dysteri*, Fauvel, 1927a, p 377, fig 129, e-k, 1930a, p 67

Branchial filaments with spatulate enlargements at the tips The triangular wing of the collar setae with numerous, more or less fine, teeth Tubes forming large, white, colonial masses

*Length* 4-7 mm

*Colour* Orange or red Gills pale or reddish at the base

*Occurrence* Gulf of Mannar, Krusadai Island, Rameswaram, Madras Harbour

*Distribution* Pacific, Indian and Atlantic Oceans

## Genus SPIRORBIS Daudin

Body asymmetrical Thoracic segments less than five Opercular peduncle without pinnules Tubes spirally coiled, dextral or sinistral

462. *Spirorbis foraminosus* Moore. (Fig 248, b).

*Spirorbis foraminosus*, Augener, 1926b, p 472, Fauvel, 1930a, p 68, 1932, p 247

Collar setae smooth, without fin-like extensions, accompanied by a few capillary setae Abdominal setae with large falciform serrated blades Operculum cylindrical, transparent, dotted, and crowned with a rim, with longitudinal grated plates Three thoracic segments. Tube dextral, keeled, wrinkled, more or less pitted with alveoli

*Occurrence* Nankauri Harbour, Nicobar Islands; Gulf of Mannar, Krusadai Island, Rameswaram Beach

*Distribution* Pacific Ocean, Nicobar Islands, Ceylon.

## LIST OF AGENTS IN INDIA FROM WHOM GOVERNMENT OF INDIA PUBLICATIONS ARE AVAILABLE

### AGRA —

English Book Depot, Taj Road  
National Book House, Jeomandi  
Wadhwa & Co., Raja Mandi

### AHMEDABAD —

Chandra Kant Chiman Lal Vora,  
Gandhi Road  
Indradhanu Book House Ltd.,  
Mission Road, Bhadra  
New Order Book Co., Ellis Bridge

### AJMER —

Banthiya & Co., Ltd., Station Road

### AKOLA —

Bakshi, Mr M G.

### ALLAHABAD —

Central Book Depot, 44, Johnston  
Ganj  
Kitabistan, 17-A, City Road  
Law Book Co., Post Box No 4,  
Albert Road  
Ram Narain Lal, 1, Bank Road  
Universal Book Agency (of Lahore),  
Post Box No 63  
Vidyarthi Book Depot, University  
Road  
Wheeler & Co., M/s A H  
Supdt Ptg & Stationery, U P

### ALWAR —

Jaina General Stores, Bazaza Bazar,

### AMBALA CANTT —

English Book Depot

### AMRITSAR —

Sikh Publishing House Ltd.,  
Court Road

### BANARAS —

Banaras Book Corporation,  
University Road, P O Lanka  
Students' Friends, University Gate,

### BANGALORE —

Book Emporium, M/s S. S., 118, G  
H Extension Basavangudi, P.O  
Vichra Sahitya Ltd., Balepet  
Standard Book Depot, Avenue Road

### BAREILLY —

Agarwal Bros., Bara Bazar  
M/s R S Vaish & Sons, Bara Bazar  
National Book Depot, Behari Pur  
Sahitya Niketan, Pulkazi

### BARODA —

Good Companions

### BIKANER —

Goyal & Co.,  
Makhanlal Damani, Bookseller etc

### BOMBAY —

Charles Lambirt & Co., P O Box  
No 4087  
Co operators Book Depot, 9, Bake-  
house Lane, Fort  
Current Book House, Hornby Road  
Dutt & Co., P.O Box No 6014, Parel  
International Book House Ltd., Ash  
Lane, Mahatma Gandhi Road  
Lakhan Book Depot, Bombay 4  
National Information & Publications  
Ltd., National House  
New Book Co., Kitar Mahal, 188-90,  
Hornby Road  
Popular Book Depot, Grant Road  
Sarkari Prakashan Ltd., 24-B Harnam  
Street, Fort  
Supdt, Govt Printing & Stationery,  
Queens Road  
Taraporevala Sons & Co., M/s. D B  
Thacker & Co., Ltd., Tripathi & Co.,  
M/s N. M Princess Street, Kalba-  
debi Road
